

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Freescale Semiconductor

Data Sheet: Advanced Information

Document Number: MCF51JE256

Rev. 4, 08/2012

An Energy-Efficient Solution from Freescale MCF51JE256/128

The MCF51JE256 series devices are members of the low-cost, low-power, high-performance ColdFire V1 family of 32-bit microcontrollers (MCUs).

Not all features are available in all devices or packages; see [Table 1](#) for a comparison of features by device.

32-Bit ColdFire V1 Central Processor Unit (CPU)

- Up to 50.33 MHz ColdFire CPU above 2.4 V and 40 MHz CPU above 2.1 V and 20 MHz CPU above 1.8 V across temperature range of -40°C to 105°C.
- ColdFire Instruction Set Revision C (ISA_C).
- 32-bit multiply and accumulate (MAC) supports signed or unsigned integer or signed fractional inputs.

On-Chip Memory

- 256 K Flash comprised of two independent 128 K flash arrays; read/program/erase over full operating voltage and temperature; allows interrupt processing while programming.
- 32 KB System Random-access memory (RAM).
- Security circuitry to prevent unauthorized access to RAM and Flash contents.

Power-Saving Modes

- Two ultra-low power stop modes. Peripheral clock enable register can disable clocks to unused modules to reduce currents.
- Time of Day (TOD) — Ultra low-power 1/4 sec counter with up to 64 sec timeout.
- Ultra-low power external oscillator that can be used in stop modes to provide accurate clock source to the TOD. 6 µs typical wake up time from stop3 mode.

Clock Source Options

- Oscillator (XOSC1) — Loop-control Pierce oscillator; 32.768 kHz crystal or ceramic resonator dedicated for TOD operation.
- Oscillator (XOSC2) for high frequency crystal input for MCG reference to be used for system clock and USB operations.
- Multipurpose Clock Generator (MCG) — PLL and FLL; precision trimming of internal reference allows 0.2% resolution and typical +0.5% to -1% deviation over temperature and voltage; supports CPU frequencies up to 50 MHz.

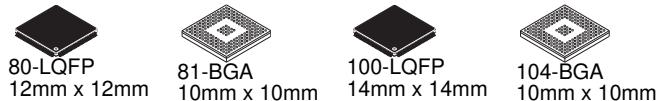

System Protection

- Watchdog computer operating properly (COP) reset with option to run from dedicated 1 kHz internal clock source or bus clock.
- Low-voltage detection with reset or interrupt; selectable trip points; separate low voltage warning with optional interrupt; selectable trip points.
- Illegal opcode and illegal address detection with reset.
- Flash block protection for each array to prevent accidental write/erasure.
- Hardware CRC to support fast cyclic redundancy checks.

Development Support

- Integrated ColdFire DEBUG_Rev_B+ interface with single wire BDM connection supports same electrical interface used by the S08 family debug modules.
- Real-time debug with 6 hardware breakpoints (4 PC, 1 address and 1 data).
- On-chip trace buffer provides programmable start/stop recording conditions.

MCF51JE256/128

Peripherals

- USB** — Dual-role USB On-The-Go (OTG) device, supports USB in either device, host or OTG configuration. On-chip transceiver and 3.3V regulator help save system cost, fully compliant with USB Specification 2.0. Allows control, bulk, interrupt and isochronous transfers.
- SCIx** — Two serial communications interfaces with optional 13-bit break; option to connect Rx input to PRACMP output on SCI1 and SCI2; High current drive on Tx on SCI1 and SCI2; wake-up from stop3 on Rx edge.
- SPI1** — Serial peripheral interface with 32-bit FIFO buffer; 16-bit or 8-bit data transfers; full-duplex or single-wire bidirectional; double-buffered transmit and receive; master or slave mode; MSB-first or LSB-first shifting.
- SPI2** — Serial peripheral interface with full-duplex or single-wire bidirectional; Double-buffered transmit and receive; Master or Slave mode; MSB-first or LSB-first shifting.
- IIC** — Up to 100 kbps with maximum bus loading; Multi-master operation; Programmable slave address; Interrupt driven byte-by-byte data transfer; supports broadcast mode and 10-bit addressing.
- CMT** — Carrier Modulator timer for remote control communications. Carrier generator, modulator and driver for dedicated infrared out (IRO). Can be used as an output compare timer.
- TPMx** — Two 4-channel Timer/PWM Module; Selectable input capture, output compare, or buffered edge- or center-aligned PWM on each channel; external clock input/pulse accumulator.
- Mini-FlexBus** — Multi-function external bus interface with user programmable chip selects and the option to multiplex address and data lines.
- PRACMP** — Analog comparator with selectable interrupt; compare option to programmable internal reference voltage; operation in stop3.
- ADC12** — 12-bit Successive approximation ADC with up to 12 single-ended channels; internal bandgap reference channel; operation in stop3; fully functional from 3.6V to 1.8V.
- PDB** — Programmable delay block with 16-bit counter and modulus and prescale to set reference clock to bus divided by 1 to bus divided by 2048; 8 trigger outputs for ADC module provides periodic coordination of ADC sampling sequence with sequence completion interrupt; Back-to-Back mode and Timed mode.
- DAC** — 12-bit resolution DAC; configurable settling time.

Input/Output

- Up to 68 GPIOs and 1 output-only pin.
- Voltage Reference output (VREFO).
- Dedicated infrared output pin (IRO) with high current sink capability.
- Up to 16 KBI pins with selectable polarity.
- Up to 16 pins of rapid general purpose I/O (GPIO).

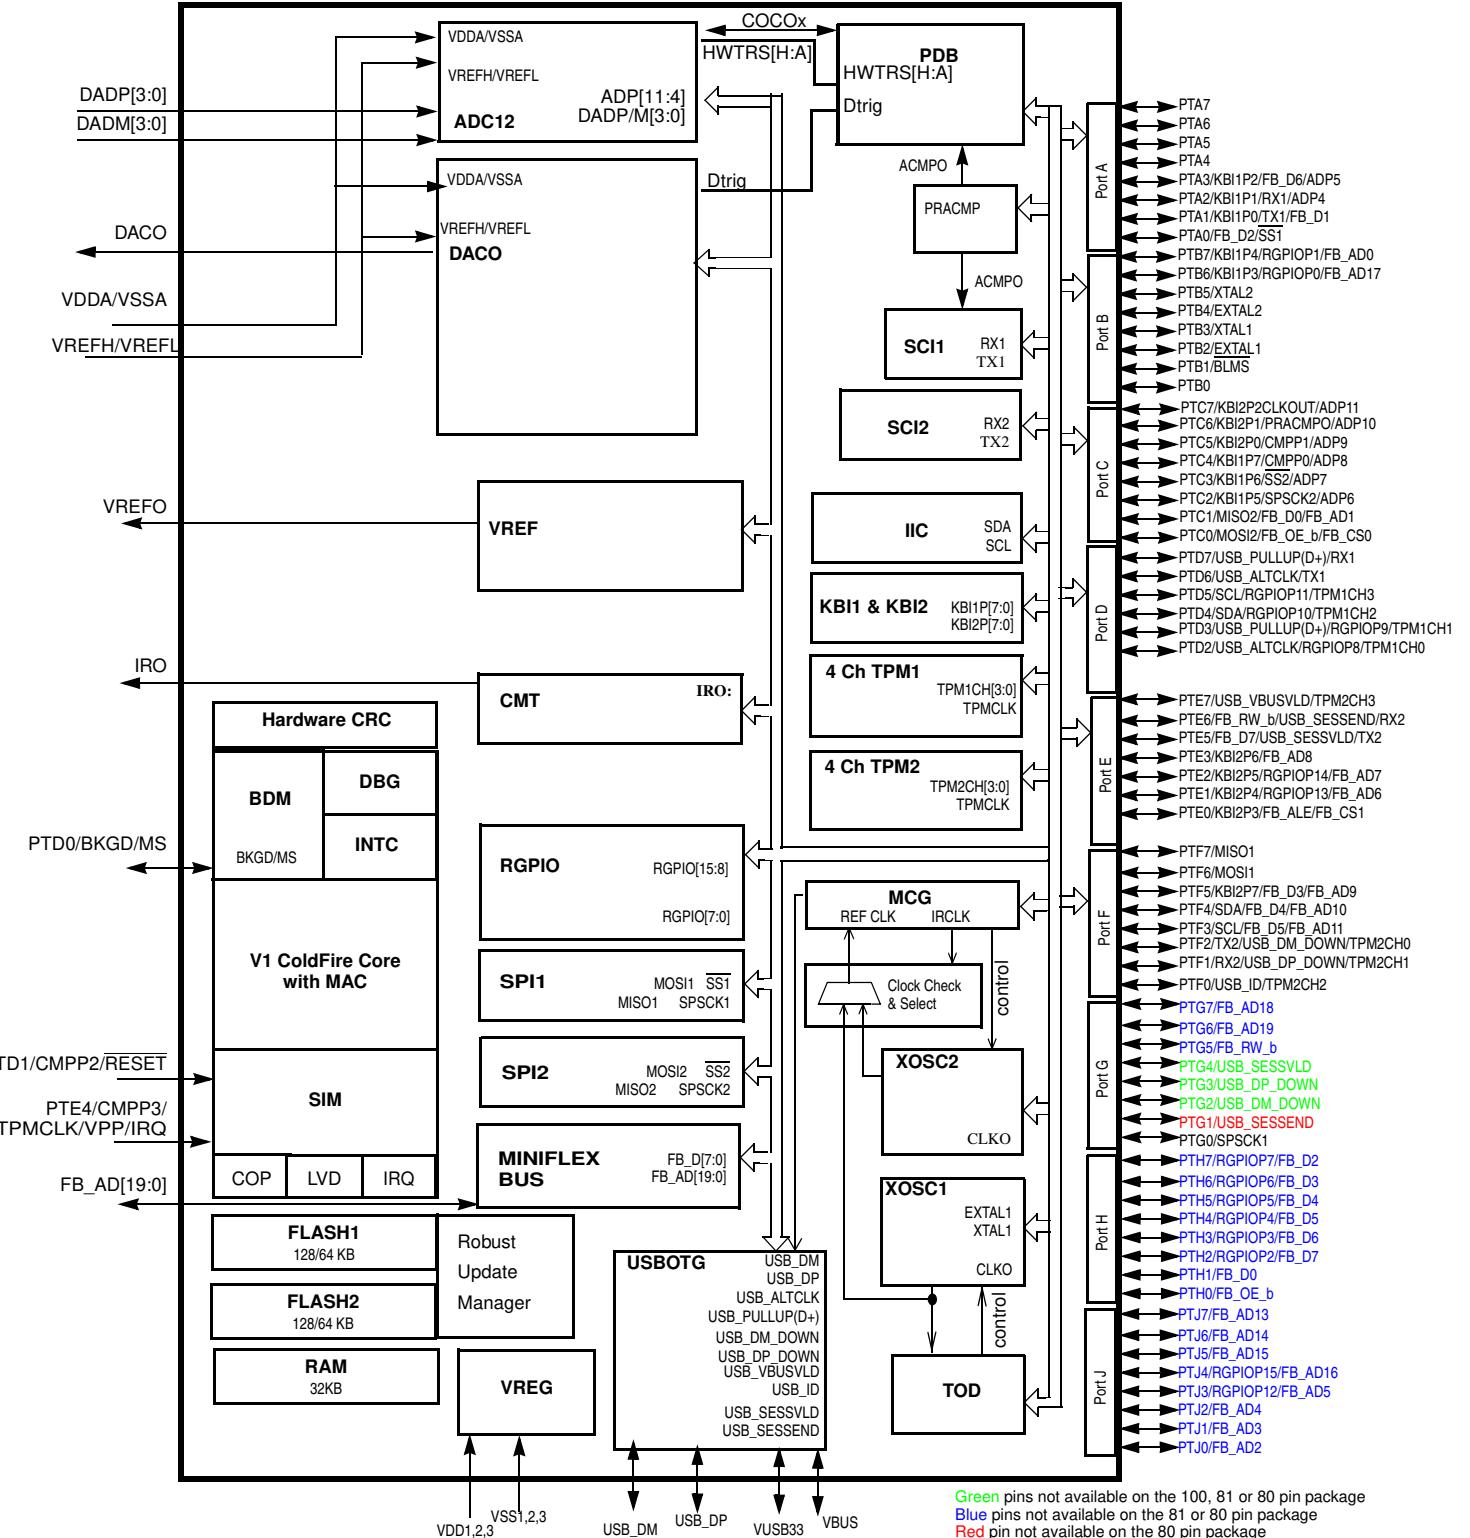

Figure 1. MCF51JE256/128 Block Diagram

1 Features

The following table provides a cross-comparison of the features of the MCF51JE256/128 according to package.

Table 1. MCF51JE Features by MCU and Package

Feature	MCF51JE256				MCF51JE128			
FLASH size (bytes)	262144				131072			
RAM size (bytes)	32K				32K			
Pin quantity	104	100	81	80	81	80		
Programmable Analog Comparator (PRACMP)	yes							
Debug Module (DBG)	yes							
Multipurpose Clock Generator (MCG)	yes							
Inter-Integrated Communication (IIC)	yes							
Interrupt Request Pin (IRQ)	yes							
Keyboard Interrupt (KBI)	16							
Digital General purpose I/O ¹	69	65	48	47	48	47		
Power and Ground Pins	8							
Time Of Day (TOD)	yes							
Serial Communications (SCI1)	yes							
Serial Communications (SCI2)	yes							
Serial Peripheral Interface (SPI1(FIFO))	yes							
Serial Peripheral Interface(SPI2)	yes							
Carrier Modulator Timer pin (IRO)	yes							
Programmable Delay Block (PDB)	yes							
TPM input clock pin (TPMCLK)	yes							
TPM1 channels	4							
TPM2 channels	4							
XOSC1	yes							
XOSC2	yes							
USBOTG	yes							
MiniFlex Bus	yes		DATA					
Rapid GPIO	16		9					
ADC single-ended channels	12							
DAC ouput pin (DACO)	yes							
Voltage reference output pin (VREFO)	yes							

¹ Port I/O count does not include \overline{BLMS} , \overline{BKGD} and IRQ. \overline{BLMS} \overline{BKGD} are Output only, IRQ is input only.

The following table describes the functional units of the MCF51JE256/128.

Table 2. MCF51JE256/128 Functional Units

Unit	Function
DAC (digital to analog converter)	Used to output voltage levels.
12-BIT SAR ADC (analog-to-digital converter)	Measures analog voltages at up to 12 bits of resolution. The ADC has up to 12 single-ended inputs.
PDB (Programmable Delay Block)	Precisely trigger the DAC FIFO buffer.
Mini-FlexBus	Provides expansion capability for off-chip memory and peripherals.
USB On-the-Go	Supports the USB On-the-Go dual-role controller.
CMT (Carrier Modulator Timer)	Infrared output used for the Remote Controller operation.
MCG (Multipurpose Clock Generator)	Provides clocking options for the device, including a phase-locked loop (PLL) and frequency-locked loop (FLL) for multiplying slower reference clock sources.
BDM (Background Debug Module)	Provides single pin debugging interface (part of the V1 ColdFire core).
CF1 CORE (V1 ColdFire Core)	Executes programs and interrupt handlers.
PRACMP	Analog comparators for comparing external analog signals against each other, or a variety of reference levels.
COP (Computer Operating Properly)	Software Watchdog.
IRQ (Interrupt Request)	Single-pin high-priority interrupt (part of the V1 ColdFire core).
CRC (Cyclic Redundancy Check)	High-speed CRC calculation.
DBG (Debug)	Provides debugging and emulation capabilities (part of the V1 ColdFire core).
FLASH (Flash Memory)	Provides storage for program code, constants, and variables.
IIC (Inter-integrated Circuits)	Supports standard IIC communications protocol and SMBus.
INTC (Interrupt Controller)	Controls and prioritizes all device interrupts.
KBI1 & KBI2	Keyboard Interfaces 1 and 2.
LVD (Low-voltage Detect)	Provides an interrupt to the ColdFire V1 CORE in the event that the supply voltage drops below a critical value. The LVD can also be programmed to reset the device upon a low voltage event.
VREF (Voltage Reference)	The Voltage Reference output is available for both on- and off-chip use.
RAM (Random-Access Memory)	Provides stack and variable storage.
GPIO (Rapid General-purpose Input/output)	Allows for I/O port access at CPU clock speeds. GPIO is used to implement GPIO functionality.
SCI1, SCI2 (Serial Communications Interfaces)	Serial communications UARTs capable of supporting RS-232 and LIN protocols.
SIM (system integration unit)	

Features

Table 2. MCF51JE256/128 Functional Units (continued)

Unit	Function
SPI1 (FIFO), SPI2 (Serial Peripheral Interfaces)	SPI1 and SPI2 provide standard master/slave capability. SPI contains a FIFO buffer in order to increase the throughput for this peripheral.
TPM1, TPM2 (Timer/PWM Module)	Timer/PWM module can be used for a variety of generic timer operations as well as pulse-width modulation.
VREG (Voltage Regulator)	Controls power management across the device.
XOSC1 and XOSC2 (Crystal Oscillators)	These devices incorporate redundant crystal oscillators. One is intended primarily for use by the TOD, and the other by the CPU and other peripherals.

2 Pinouts and Pin Assignments

3 Preliminary Electrical Characteristics

This section contains electrical specification tables and reference timing diagrams for the MCF51JE256/128 microcontroller, including detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications.

The electrical specifications are preliminary and are from previous designs or design simulations. These specifications may not be fully tested or guaranteed at this early stage of the product life cycle. These specifications will, however, be met for production silicon. Finalized specifications will be published after complete characterization and device qualifications have been completed.

NOTE

The parameters specified in this data sheet supersede any values found in the module specifications.

3.1 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding, the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

Table 4. Parameter Classifications

P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

NOTE

The classification is shown in the column labeled "C" in the parameter tables where appropriate.

3.2 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in the following table may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this section.

Table 5. Absolute Maximum Ratings

#	Rating	Symbol	Value	Unit
1	Supply voltage	V_{DD}	-0.3 to 3.8	V
2	Maximum current into V_{DD}	I_{DD}	120	mA
3	Digital Input voltage	V_{In}	-0.3 to $V_{DD} + 0.3$	V
4	Instantaneous maximum current Single pin limit (applies to all port pins) ^{1, 2, 3}	I_D	± 25	mA
5	Storage temperature range	T_{stg}	-55 to 150	°C

¹ Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive (V_{DD}) and negative (V_{SS}) clamp voltages, then use the larger of the two resistance values.

² All functional non-supply pins are internally clamped to V_{SS} and V_{DD} .

³ Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{In} > V_{DD}$) is greater than I_{DD} , the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if the clock rate is very low (which would reduce overall power consumption).

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either V_{SS} or V_{DD}).

3.3 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and it is user-determined rather than being controlled by the MCU design. In order to take $P_{I/O}$ into account in power calculations, determine the difference between actual pin voltage and V_{SS} or V_{DD} and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and V_{SS} or V_{DD} will be very small.

Table 6. Thermal Characteristics

#	Symbol	Rating	Value	Unit
1	T_A	Operating temperature range (packaged):		°C
		MCF51JE256	-40 to 105	
		MCF51JE128	-40 to 105	
2	T_{JMAX}	Maximum junction temperature	135	°C
3	θ_{JA}	Thermal resistance ^{1,2,3,4} Single-layer board — 1s		°C/W
		104-pin MBGA	67	
		100-pin LQFP	53	
		81-pin MBGA	67	
		80-pin LQFP	53	
4	θ_{JA}	Thermal resistance ^{1, 2, 3, 4} Four-layer board — 2s2p		°C/W
		104-pin MBGA	39	
		100-pin LQFP	41	
		81-pin MBGA	39	
		80-pin LQFP	39	

¹ Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

² Junction to Ambient Natural Convection

³ 1s — Single layer board, one signal layer

⁴ 2s2p — Four layer board, 2 signal and 2 power layers

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \text{Eqn. 1}$$

where:

T_A = Ambient temperature, °C

θ_{JA} = Package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$, Watts — chip internal power

$P_{I/O}$ = Power dissipation on input and output pins — user determined

For most applications, $P_{I/O} \ll P_{int}$ and can be neglected. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = K \div (T_J + 273^\circ\text{C}) \quad \text{Eqn. 2}$$

Solving [Equation 1](#) and [Equation 2](#) for K gives:

$$K = P_D \times (T_A + 273^\circ\text{C}) + \theta_{JA} \times (P_D)^2 \quad \text{Eqn. 3}$$

Preliminary Electrical Characteristics

where K is a constant pertaining to the particular part. K can be determined from [Equation 3](#) by measuring P_D (at equilibrium) for a known T_A . Using this value of K, the values of P_D and T_J can be obtained by solving [Equation 1](#) and [Equation 2](#) iteratively for any value of T_A .

3.4 ESD Protection Characteristics

Although damage from static discharge is much less common on these devices than on early CMOS circuits, normal handling precautions should be used to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

All ESD testing is in conformity with CDF-AEC-Q00 Stress Test Qualification for Automotive Grade Integrated Circuits. (<http://www.aecouncil.com/>) This device was qualified to AEC-Q100 Rev E.

A device is considered to have failed if, after exposure to ESD pulses, the device no longer meets the device specification requirements. Complete dc parametric and functional testing is performed per the applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

Table 7. ESD and Latch-up Test Conditions

Model	Description	Symbol	Value	Unit
Human Body	Series Resistance	R1	1500	Ω
	Storage Capacitance	C	100	pF
	Number of Pulse per pin	—	3	—
Machine	Series Resistance	R1	0	Ω
	Storage Capacitance	C	200	pF
	Number of Pulse per pin	—	3	—
Latch-up	Minimum input voltage limit	—	-2.5	V
	Maximum input voltage limit	—	7.5	V

Table 8. ESD and Latch-Up Protection Characteristics

#	Rating	Symbol	Minimum	Maximum	Unit	C

		V _{DD} rising		2.36	2.46	2.56	V	P
21	V _{LVWL}	Low-voltage warning threshold — low range ⁹						
		V _{DD} falling		2.11	2.16	2.22	V	P
		V _{DD} rising		2.16	2.21	2.27	V	P
22	V _{hys}	Low-voltage inhibit reset/recover hysteresis ¹⁰	—	—	50	—	mV	C
23	V _{BG}	Bandgap Voltage Reference ¹¹	—	1.145	1.17	1.195	V	P

¹ Typical values are measured at 25°C. Characterized, not tested

² As the supply voltage rises, the LVD circuit will hold the MCU in reset until the supply has risen above V_{LVDL}.

³ Does not include analog module pins. Dedicated analog pins should not be pulled to V_{DD} or V_{SS} and should be left floating when not used to reduce current leakage.

⁴ Measured with V_{IN} = V_{DD}.

⁵ All functional non-supply pins are internally clamped to V_{SS} and V_{DD}, except PTD1.

⁶ Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

⁷ Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current (V_{IN} > V_{DD}) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if clock rate is very low (which would reduce overall power consumption).

⁸ Maximum is highest voltage that POR is guaranteed.

⁹ Run at 1 MHz bus frequency.

¹⁰ Low voltage detection and warning limits measured at 1 MHz bus frequency.

¹¹ Factory trimmed at $V_{DD} = 3.0$ V, Temp = 25°C.

3.6 Supply Current Characteristics

Table 10. Supply Current Characteristics

			N/A	2	47	59	μA	105	C

¹ Data in Typical column was characterized at 3.0 V, 25°C or is typical recommended value.

² ON = System Clock Gating Control registers turn on system clock to the corresponding modules.

³ OFF = System Clock Gating Control registers turn off system clock to the corresponding modules.

⁴ All digital pins must be configured to a known state to prevent floating pins from adding current. Smaller packages may have some pins that are not bonded out; however, software must still be configured to the largest pin package available so that all pins are in a known state. Otherwise, floating pins that are not bonded in the smaller packages may result in a higher current draw. NOTE: I/O pins are configured to output low; input-only pins are configured to pullup-enabled. IRO pin connects to ground. FB_ADI2 pin is pullup-enabled. DACO, and VREFO pins are at reset state and unconnected.
