## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Single-Ended, Rail-to-Rail I/O, Low-Gain PGA

## Features

- Multiplexed Inputs: 1 or 2 channels
- 8 Gain Selections:
- +1, +2, +4, +5, +8, +10, +16 or +32 V/V
- Serial Peripheral Interface (SPI ${ }^{\top M}$ )
- Rail-to-Rail Input and Output
- Low Gain Error: $\pm 1 \%$ (max.)
- Offset Mismatch Between Channels: $0 \mu \mathrm{~V}$
- High Bandwidth: 1 to 18 MHz (typ.)
- Low Noise: $10 \mathrm{nV} / \mathrm{JHz}$ @ 10 kHz (typ.)
- Low Supply Current: 1.0 mA (typ.)
- Single Supply: 2.5 V to 5.5 V
- Extended Temperature Range: $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$

## Typical Applications

- A/D Converter Driver
- Multiplexed Analog Applications
- Data Acquisition
- Industrial Instrumentation
- Test Equipment
- Medical Instrumentation

## Block Diagram

## Description

The Microchip Technology Inc. MCP6S91/2/3 are analog Programmable Gain Amplifiers (PGAs). They can be configured for gains from $+1 \mathrm{~V} / \mathrm{V}$ to $+32 \mathrm{~V} / \mathrm{V}$ and the input multiplexer can select one of up to two channels through a SPI port. The serial interface can also put the PGA into shutdown to conserve power. These PGAs are optimized for high-speed, low offset voltage and single-supply operation with rail-to-rail input and output capability. These specifications support singlesupply applications needing flexible performance or multiple inputs.

The one-channel MCP6S91 and the two-channel MCP6S92 are available in 8-pin PDIP, SOIC and MSOP packages. The two-channel MCP6S93 is available in a 10-pin MSOP package. All parts are fully specified from $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

## Package Types

### 1.0 ELECTRICAL CHARACTERISTICS

$V_{D D}-V_{S S}$.....................................................................7.0V
All inputs and outputs.................... $\mathrm{V}_{\mathrm{SS}}-0.3 \mathrm{~V}$ to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$
Difference Input voltage ..................................... $\left|\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{\mathrm{SS}}\right|$
Output Short Circuit Current ...................................continuous
Current at Input Pin ....................................................... $\pm 2 \mathrm{~mA}$
Current at Output and Supply Pins .............................. $\pm 30 \mathrm{~mA}$
Storage temperature ..................................... $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Junction temperature ................................................ $+150^{\circ} \mathrm{C}$
ESD protection on all pins (HBM; MM) ............... $\geq 4 \mathrm{kV}$; 200 V
$\dagger$ Notice: Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is stress rating only and functional operation of the device at perational listings of this specification is not implied may affect device reliability.

## PIN FUNCTION TABLE

| Name | Function |
| :---: | :--- |
| $\mathrm{V}_{\text {OUT }}$ | Analog Output |
| $\mathrm{CH} 0, \mathrm{CH} 1$ | Analog Inputs |
| $\mathrm{V}_{\text {REF }}$ | External Reference Pin |
| $\mathrm{V}_{\text {SS }}$ | Negative Power Supply |
| $\overline{\mathrm{CS}}$ | SPI Chip Select |
| SI | SPI Serial Data Input |
| SO | SPI Serial Data Output |
| SCK | SPI Clock Input |
| $\mathrm{V}_{\mathrm{DD}}$ | Positive Power Supply |

## DC CHARACTERISTICS

| Electrical Specifications: Unless otherwise indicated, $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD}}=+2.5 \mathrm{~V}$ to $+5.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{SS}}=\mathrm{GND}, \mathrm{V}_{\mathrm{REF}}=\mathrm{V}_{\mathrm{SS}}, \mathrm{G}=+1 \mathrm{~V} / \mathrm{V}$, Input $=\mathrm{CH} 0=(0.3 \mathrm{~V}) / \mathrm{G}, \mathrm{CH} 1=0.3 \mathrm{~V}, \mathrm{R}_{\mathrm{L}}=10 \mathrm{k} \Omega$ to $\mathrm{V}_{\mathrm{DD}} / 2, \mathrm{SI}$ and SCK are tied low and $\overline{\mathrm{CS}}$ is tied high. |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Parameters | Sym | Min | Typ | Max | Units | Conditions |
| Amplifier Inputs (CH0, CH1) |  |  |  |  |  |  |
| Input Offset Voltage | $\mathrm{V}_{\mathrm{OS}}$ | -4 | - | +4 | mV | $\mathrm{G}=+1$ |

| Reference Input ( $\mathrm{V}_{\text {REF }}$ ) |  |  |  |  |  |  |
| Input Impedance | $\mathrm{Z}_{\text {IN_REF }}$ | - | (5/G)\||6 | - | k $\Omega \\|$ \| pF |  |
| Voltage Range | $\mathrm{V}_{\text {IVR_REF }}$ | $\mathrm{V}_{S S}$ | - | $V_{D D}$ | V | (Note 2) |
| Amplifier Gain |  |  |  |  |  |  |
| Nominal Gains | G | - | 1 to 32 | - | V/V | +1, +2, +4, +5, +8, +10, +16 or +32 |
| DC Gain Error $\quad \begin{array}{ll}G=+1 \\ & G \geq+2\end{array}$ | $\begin{aligned} & \mathrm{g}_{\mathrm{E}} \\ & \mathrm{~g}_{\mathrm{E}} \end{aligned}$ | $\begin{aligned} & -0.2 \\ & -1.0 \end{aligned}$ | - | $\begin{aligned} & +0.2 \\ & +1.0 \end{aligned}$ | $\begin{aligned} & \% \\ & \% \\ & \hline \end{aligned}$ | $\begin{aligned} & \mathrm{V}_{\text {OUT }} \approx 0.3 \mathrm{~V} \text { to } \mathrm{V}_{\mathrm{DD}}-0.3 \mathrm{~V} \\ & \mathrm{~V}_{\text {OUT }} \approx 0.3 \mathrm{~V} \text { to } \mathrm{V}_{\mathrm{DD}}-0.3 \mathrm{~V} \end{aligned}$ |
|  | $\begin{aligned} & \Delta \mathrm{G} / \Delta \mathrm{T}_{\mathrm{A}} \\ & \Delta \mathrm{G} / \Delta \mathrm{T}_{\mathrm{A}} \end{aligned}$ | - | $\begin{aligned} & \pm 0.0002 \\ & \pm 0.0004 \end{aligned}$ | - | $\begin{aligned} & \% /{ }^{\circ} \mathrm{C} \\ & \% /{ }^{\circ} \mathrm{C} \end{aligned}$ | $\begin{aligned} & \mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C} \text { to }+125^{\circ} \mathrm{C} \\ & \mathrm{~T}_{\mathrm{A}}=-40^{\circ} \mathrm{C} \text { to }+125^{\circ} \mathrm{C} \end{aligned}$ |

Note 1: $R_{L A D}\left(R_{F}+R_{G}\right.$ in Figure 4-1) connects $V_{R E F}$, $V_{\text {OUT }}$ and the inverting input of the internal amplifier. The MCP6S92 has $\mathrm{V}_{\text {REF }}$ tied internally to $\mathrm{V}_{S S}$, so $\mathrm{V}_{S S}$ is coupled to the internal amplifier and the PSRR spec describes PSRR+ only. It is recommended that the MCP6S92's $\mathrm{V}_{\mathrm{SS}}$ pin be tied directly to ground to avoid noise problems.
2: The MCP6S92's $\mathrm{V}_{\text {IVR }}$ and $\mathrm{V}_{\text {IVR_REF }}$ are not tested in production; they are set by design and characterization.
3: $\mathrm{I}_{\mathrm{Q}}$ includes current in $\mathrm{R}_{\text {LAD }}$ (typically $60 \mu \mathrm{~A}$ at $\mathrm{V}_{\mathrm{OUT}}=0.3 \mathrm{~V}$ ). Both $\mathrm{I}_{\mathrm{Q}}$ and $\mathrm{I}_{\mathrm{Q} \text { _SHDN }}$ exclude digital switching currents.

## DC CHARACTERISTICS (CONTINUED)

| Electrical Specifications: Unless otherwise indicated, $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD}}=+2.5 \mathrm{~V}$ to $+5.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{SS}}=\mathrm{GND}, \mathrm{V}_{\mathrm{REF}}=\mathrm{V}_{\mathrm{SS}}, \mathrm{G}=+1 \mathrm{~V} / \mathrm{V}$, Input $=\mathrm{CH} 0=(0.3 \mathrm{~V}) / \mathrm{G}, \mathrm{CH} 1=0.3 \mathrm{~V}, \mathrm{R}_{\mathrm{L}}=10 \mathrm{k} \Omega$ to $\mathrm{V}_{\mathrm{DD}} / 2, \mathrm{SI}$ and SCK are tied low and $\overline{\mathrm{CS}}$ is tied high. |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Parameters | Sym | Min | Typ | Max | Units | Conditions |
| Ladder Resistance |  |  |  |  |  |  |
| Ladder Resistance | $\mathrm{R}_{\text {LAD }}$ | 3.4 | 4.9 | 6.4 | k $\Omega$ | (Note 1) |
| Ladder Resistance across Temperature | $\Delta \mathrm{R}_{\text {LAD }} / \Delta \mathrm{T}_{\mathrm{A}}$ | - | +0.028 | - | \%/ ${ }^{\circ} \mathrm{C}$ | $\mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ (Note 1) |
| Amplifier Output |  |  |  |  |  |  |
| DC Output Non-linearity $\begin{aligned} \mathrm{G} & =+1 \\ \mathrm{G} & \geq+2\end{aligned}$ | $\mathrm{V}_{\mathrm{ONL}}$ <br> $V_{\mathrm{ONL}}$ |  | $\begin{gathered} \pm 0.18 \\ \pm 0.050 \end{gathered}$ |  | $\begin{aligned} & \% \text { of FSR } \\ & \% \text { of } F S R \end{aligned}$ | $\begin{aligned} & \mathrm{V}_{\mathrm{OUT}} \approx 0.3 \mathrm{~V} \text { to } \mathrm{V}_{\mathrm{DD}}-0.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD}}=5.0 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{OUT}} \approx 0.3 \mathrm{~V} \text { to } \mathrm{V}_{\mathrm{DD}}-0.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD}}=5.0 \mathrm{~V} \end{aligned}$ |
| Maximum Output Voltage Swing | Voh_ANA, <br> $V_{\text {OL_ANA }}$ | $\mathrm{V}_{\text {SS }}+20$ | - | $\mathrm{V}_{\text {DD }}-100$ | mV | $\mathrm{G} \geq+2$; 0.5 V output overdrive |
|  |  | $\mathrm{V}_{\text {SS }}+60$ | - | $\mathrm{V}_{\mathrm{DD}}-60$ |  | $\mathrm{G} \geq+2 ; 0.5 \mathrm{~V}$ output overdrive, $V_{\text {REF }}=V_{D D} / 2$ |
| Short Circuit Current | ISC | - | $\pm 25$ | - | mA |  |
| Power Supply |  |  |  |  |  |  |
| Supply Voltage | $V_{\text {DD }}$ | 2.5 | - | 5.5 | V |  |
| Minimum Valid Supply Voltage | $\mathrm{V}_{\text {DD_VAL }}$ | - | 0.4 | 2.0 | V | Register data still valid |
| Quiescent Current | $\mathrm{I}_{\mathrm{Q}}$ | 0.4 | 1.0 | 1.6 | mA | $\mathrm{I}_{\mathrm{O}}=0$ (Note 3) |
| Quiescent Current, Shutdown Mode | $\mathrm{I}_{\mathrm{Q} \text { _SHDN }}$ | - | 30 | - | pA | $\mathrm{I}_{\mathrm{O}}=0$ (Note 3) |

Note 1: $R_{L A D}\left(R_{F}+R_{G}\right.$ in Figure 4-1) connects $V_{R E F}, V_{\text {OUT }}$ and the inverting input of the internal amplifier. The MCP6S92 has $\mathrm{V}_{\text {REF }}$ tied internally to $\mathrm{V}_{S S}$, so $\mathrm{V}_{S S}$ is coupled to the internal amplifier and the PSRR spec describes PSRR+ only. It is recommended that the MCP6S92's $\mathrm{V}_{\text {SS }}$ pin be tied directly to ground to avoid noise problems.
2: The MCP6S92's $\mathrm{V}_{\text {IVR }}$ and $\mathrm{V}_{\text {IVR_REF }}$ are not tested in production; they are set by design and characterization.
3: $\mathrm{I}_{\mathrm{Q}}$ includes current in $\mathrm{R}_{\text {LAD }}$ (typically $60 \mu \mathrm{~A}$ at $\mathrm{V}_{\mathrm{OUT}}=0.3 \mathrm{~V}$ ). Both $\mathrm{I}_{\mathrm{Q}}$ and $\mathrm{I}_{\mathrm{Q} \text { _SHDN }}$ exclude digital switching currents.

## AC CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{DD}}=+2.5 \mathrm{~V}$ to $+5.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{SS}}=\mathrm{GND}, \mathrm{V}_{\mathrm{REF}}=\mathrm{V}_{\mathrm{SS}}, \mathrm{G}=+1 \mathrm{~V} / \mathrm{V}$, Input $=\mathrm{CH} 0=(0.3 \mathrm{~V}) / \mathrm{G}, \mathrm{CH} 1=0.3 \mathrm{~V}, \mathrm{R}_{\mathrm{L}}=10 \mathrm{k} \Omega$ to $\mathrm{V}_{\mathrm{DD}} / 2, \mathrm{C}_{\mathrm{L}}=60 \mathrm{pF}, \mathrm{SI}$ and SCK are tied low and $\overline{\mathrm{CS}}$ is tied high.

| Channel and Gain Select Timing |  |  |  |  |  |  |
| Channel Select Time | ${ }^{\text {t }} \mathrm{CH}$ | - | 1.5 | - | $\mu \mathrm{s}$ | $\mathrm{CHx}=0.6 \mathrm{~V}, \mathrm{CHy}=0.3 \mathrm{~V}, \mathrm{G}=1 \text {, }$ <br> CHx to CHy select, $\overline{C S}=0.7 \mathrm{~V}_{\text {DD }} \text { to } \mathrm{V}_{\text {OUT }} 90 \% \text { point }$ |
| Gain Select Time | $t_{G}$ | - | 1 | - | $\mu \mathrm{s}$ | $\begin{aligned} & C H x=C H y=0.3 V, \\ & G=5 \text { to } G=1 \text { select, } \\ & C S=0.7 V_{D D} \text { to } V_{\text {OUT }} 90 \% \text { point } \end{aligned}$ |
| Shutdown Mode Timing |  |  |  |  |  |  |
| Out of Shutdown mode ( $\overline{\mathrm{CS}}$ goes high) to Amplifier Output Turn-on Time | $\mathrm{t}_{\mathrm{ON}}$ | - | 3.5 | 10 | $\mu \mathrm{s}$ | $\overline{\mathrm{CS}}=0.7 \mathrm{~V}_{\text {DD }}$ to $\mathrm{V}_{\text {OUT }} 90 \%$ point |
| Into Shutdown mode ( $\overline{\mathrm{CS}}$ goes high) to Amplifier Output High-Z Turn-off Time | $\mathrm{t}_{\text {OFF }}$ | - | 1.5 | - | $\mu \mathrm{s}$ | $\overline{\mathrm{CS}}=0.7 \mathrm{~V}_{\text {DD }}$ to $\mathrm{V}_{\text {OUT }} 90 \%$ point |

Note 1: Not tested in production. Set by design and characterization.
2: When using the device in the daisy-chain configuration, maximum clock frequency is determined by a combination of propagation delay time ( $t_{D O} \leq 80 \mathrm{~ns}$ ), data input set-up time ( $\mathrm{t}_{\mathrm{SU}} \geq 40 \mathrm{~ns}$ ), SCK high time ( $\mathrm{t}_{\mathrm{HI}} \geq 40 \mathrm{~ns}$ ) and SCK rise and fall times of 5 ns . Maximum $\mathrm{f}_{\text {SCK }}$ is therefore $\approx 5.8 \mathrm{MHz}$.

## TEMPERATURE CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, $\mathrm{V}_{\mathrm{DD}}=+2.5 \mathrm{~V}$ to $+5.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{SS}}=\mathrm{GND}$.

| Parameters | Sym | Min | Typ | Max | Units | Conditions |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Temperature Ranges |  |  |  |  |  |  |
| Specified Temperature Range | $\mathrm{T}_{\mathrm{A}}$ | -40 | - | +125 | ${ }^{\circ} \mathrm{C}$ | (Note 1) |
| Operating Temperature Range | $\mathrm{T}_{\mathrm{A}}$ | -40 | - | +125 | ${ }^{\circ} \mathrm{C}$ |  |
| Storage Temperature Range | $\mathrm{T}_{\mathrm{A}}$ | -65 | - | +150 | ${ }^{\circ} \mathrm{C}$ |  |
| Thermal Package Resistances |  |  |  |  |  |  |
| Thermal Resistance, 8L-PDIP | $\theta_{\mathrm{JA}}$ | - | 85 | - | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |  |
| Thermal Resistance, 8L-SOIC | $\theta_{\mathrm{JA}}$ | - | 163 | - | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |  |
| Thermal Resistance, 8L-MSOP | $\theta_{\mathrm{JA}}$ | - | 206 | - | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |  |
| Thermal Resistance, 10L-MSOP | $\theta_{J A}$ | - | 143 | - | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |  |

Note 1: Operation in this range must not cause $T_{J}$ to exceed Maximum Junction Temperature $\left(+150^{\circ} \mathrm{C}\right)$.

### 1.1 DC Output Voltage Specs / Model

### 1.1.1 IDEAL MODEL

The ideal PGA output voltage ( $\mathrm{V}_{\text {OUT }}$ ) is:
EQUATION 1-1:

$$
V_{O_{-} I D}=G_{V I N} \quad V_{R E F}=V_{S S}=0 V
$$

Where:
G is the nominal gain
(see Figure 1-6). This equation holds when there are no gain or offset errors and when the $\mathrm{V}_{\text {REF }}$ pin is tied to a low-impedance source ( $\ll 0.1 \Omega$ ) at ground potential ( $\mathrm{V}_{\mathrm{SS}}=0 \mathrm{~V}$ ).

### 1.1.2 LINEAR MODEL

The PGA's linear region of operation, including offset and gain errors, is modeled by the line $\mathrm{V}_{\mathrm{O}}$ LIN shown in Figure 1-6.

## EQUATION 1-2:

$$
\begin{aligned}
V_{O-L I N} & =G\left(1+g_{E}\right)\left(V_{I N}-\frac{0.3 V}{G}+V_{O S}\right)+0.3 V \\
V_{R E F} & =V_{S S}=0 V
\end{aligned}
$$

The end points of this line are at $\mathrm{V}_{\mathrm{O}_{-1 \mathrm{D}}}=0.3 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{DD}}-0.3 \mathrm{~V}$. Figure $1-6$ shows the relationship between the gain and offset specifications referred to in the electrical specifications as follows:

EQUATION 1-3:

$$
\begin{gathered}
g_{E}=100 \% \frac{V_{2}-V_{I}}{G\left(V_{D D}-0.6 V\right)} \\
V_{O S}=\frac{V_{1}}{G\left(1+g_{E}\right)} \quad G=+1
\end{gathered}
$$

The DC Gain Drift ( $\Delta \mathrm{G} / \Delta \mathrm{T}_{\mathrm{A}}$ ) can be calculated from the change in $g_{E}$ across temperature. This is shown in the following equation:

EQUATION 1-4:

$$
\Delta G / \Delta T_{A}=\frac{\Delta g_{E}}{\Delta T_{A}}
$$

FIGURE 1-6: Output Voltage Model with the standard condition $V_{\text {REF }}=V_{S S}=0 \mathrm{~V}$.

### 1.1.3 OUTPUT NON-LINEARITY

Figure $1-7$ shows the Integral Non-Linearity (INL) of the output voltage.

## EQUATION 1-5:

$$
I N L=V_{O U T}-V_{O-L I N}
$$

The output non-linearity specification in the Electrical Specifications (with units of: \% of FSR) is related to Figure 1-7 by:

## EQUATION 1-6:

$$
V_{O N L}=\frac{\max \left(V_{3}, V_{4}\right)}{V_{D D}-0.6 V} \cdot 100 \%
$$

The Full-Scale Range (FSR) is $\mathrm{V}_{\mathrm{DD}}-0.6 \mathrm{~V}$ ( 0.3 V to $\mathrm{V}_{\mathrm{DD}}-0.3 \mathrm{~V}$ ).

FIGURE 1-7: $\quad$ Output Voltage INL with the standard condition $V_{R E F}=V_{S S}=0 \mathrm{~V}$.

### 1.1.4 DIFFERENT $\mathrm{V}_{\text {REF }}$ CONDITIONS

Some of the plots in Section 2.0 "Typical Performance Curves", have the conditions $\mathrm{V}_{\mathrm{REF}}=\mathrm{V}_{\mathrm{DD}} / 2$ or $V_{\text {REF }}=V_{D D}$. The equations and figures above are easily modified for these conditions. The ideal $\mathrm{V}_{\text {OUT }}$ equation becomes:

EQUATION 1-7:

$$
\begin{gathered}
V_{O_{-} I D}=V_{R E F}+G\left(V_{I N}-V_{R E F}\right) \\
V_{D D} \geq V_{R E F}>V_{S S}=0 V
\end{gathered}
$$

The complete linear model is:

## EQUATION 1-8:

$$
\begin{gathered}
V_{O N_{-} L I N}=G\left(1+g_{E}\right)\left(V_{I N}-V_{I N_{-} L}+V_{O S}\right)+0.3 \mathrm{~V} \\
V_{R E F}=V_{S S}=0 \mathrm{~V}
\end{gathered}
$$

where the new $\mathrm{V}_{\mathrm{IN}}$ end points are:
EQUATION 1-9:

$$
\begin{gathered}
V_{I N_{-} L}=\frac{0.3 V-V_{R E F}}{G}+V_{R E F} \\
V_{I N_{-} H}=\frac{V_{D D}-0.3 V-V_{R E F}}{G}+V_{R E F}
\end{gathered}
$$

The equations for extracting the specifications do not change.

### 2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Note: Unless otherwise indicated, $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}, \quad \mathrm{V}_{\mathrm{DD}}=+2.5 \mathrm{~V}$ to $+5.5 \mathrm{~V}, \quad \mathrm{~V}_{\mathrm{SS}}=\mathrm{GND}, \quad \mathrm{V}_{\mathrm{REF}}=\mathrm{V}_{\mathrm{SS}}, \mathrm{G}=+1 \mathrm{~V} / \mathrm{V}$, Input $=\mathrm{CH} 0=(0.3 \mathrm{~V}) / \mathrm{G}, \mathrm{CH} 1=0.3 \mathrm{~V}, \mathrm{R}_{\mathrm{L}}=10 \mathrm{k} \Omega$ to $\mathrm{V}_{\mathrm{DD}} / 2$ and $\mathrm{C}_{\mathrm{L}}=60 \mathrm{pF}$.

### 3.0 PIN DESCRIPTIONS

Descriptions of the pins are listed in Table 3-1.
TABLE 3-1: PIN FUNCTION TABLE

| MCP6S91 | MCP6S92 | MCP6S93 | Symbol |  |
| :---: | :---: | :---: | :---: | :--- |
| 1 | 1 | 1 | $\mathrm{~V}_{\text {OUT }}$ | Analog Output |
| 2 | 2 | 2 | CH 0 | Analog Input |
| - | 3 | 3 | CH 1 | Analog Input |
| 3 | - | 4 | $\mathrm{~V}_{\text {REF }}$ | External Reference Pin |
| 4 | 4 | 5 | $\mathrm{~V}_{\text {SS }}$ | Negative Power Supply |
| 5 | 5 | 6 | $\overline{\mathrm{CS}}$ | SPI $^{\text {TM }}$ Chip Select |
| 6 | 6 | 7 | SI | SPI Serial Data Input |
| - | - | 8 | SO | SPI Serial Data Output |
| 7 | 7 | 9 | SCK | SPI Clock Input |
| 8 | 8 | 10 | $\mathrm{~V}_{\text {DD }}$ | Positive Power Supply |

### 3.1 Analog Output

The output pin ( $\mathrm{V}_{\mathrm{OUT}}$ ) is a low-impedance voltage source. The selected gain (G), selected input (CHO, CH 1 ) and voltage at $\mathrm{V}_{\text {REF }}$ determine its value.

### 3.2 Analog Inputs (CH0, CH1)

The inputs CH 0 and CH 1 connect to the signal sources. They are high-impedance CMOS inputs with low bias currents. The internal MUX selects which one is amplified to the output.

### 3.3 External Reference Voltage ( $\mathrm{V}_{\mathrm{REF}}$ )

The $V_{\text {REF }}$ pin, which is an analog input, should be at a voltage between $\mathrm{V}_{\mathrm{SS}}$ and $\mathrm{V}_{\mathrm{DD}}$ (the MCP6S92 has $\mathrm{V}_{\text {REF }}$ tied internally to $\mathrm{V}_{\mathrm{SS}}$ ). The voltage at this pin shifts the output voltage.

### 3.4 Power Supply ( $\mathrm{V}_{\mathrm{SS}}$ and $\mathrm{V}_{\mathrm{DD}}$ )

The Positive Power Supply Pin ( $\mathrm{V}_{\mathrm{DD}}$ ) is 2.5 V to 5.5 V higher than the Negative Power Supply Pin ( $\mathrm{V}_{\mathrm{SS}}$ ). For normal operation, the other pins are at voltages between $\mathrm{V}_{\mathrm{SS}}$ and $\mathrm{V}_{\mathrm{DD}}$.
Typically, these parts are used in a single (positive) supply configuration. In this case, $\mathrm{V}_{\mathrm{SS}}$ is connected to ground and $V_{D D}$ is connected to the supply. $V_{D D}$ will need a local bypass capacitor (typically $0.01 \mu \mathrm{~F}$ to $0.1 \mu \mathrm{~F}$ ) within 2 mm of the $\mathrm{V}_{\mathrm{DD}}$ pin. These parts can share a bulk capacitor with analog parts (typically $2.2 \mu \mathrm{~F}$ to $10 \mu \mathrm{~F}$ ) within 100 mm of the $\mathrm{V}_{\mathrm{DD}}$ pin.

### 3.5 Digital Inputs

The SPI interface inputs are: Chip Select ( $\overline{\mathrm{CS}})$, Serial Input (SI) and Serial Clock (SCK). These are Schmitttriggered, CMOS logic inputs.

### 3.6 Digital Output

The MCP6S93 device has a SPI interface Serial Output (SO) pin. This is a CMOS push-pull output and does not ever go High-Z. Once the device is deselected ( $\overline{\mathrm{CS}}$ goes high), SO is forced low. This feature supports daisy-chaining, as explained in Section 5.3 "DaisyChain Configuration".

### 4.0 ANALOG FUNCTIONS

The MCP6S91/2/3 family of Programmable Gain Amplifiers (PGA) is based on simple analog building blocks (see Figure 4-1). Each of these blocks will be explained in more detail in the following subsections.

FIGURE 4-1: PGA Block Diagram.

### 4.1 Input MUX

The MCP6S91 has one input, while the MCP6S92 and MCP6S93 have two inputs (see Figure 4-1).

For the lowest input current, float unused inputs. Tying these pins to a voltage near the active channel's bias voltage also works well. For simplicity, they can be tied to $\mathrm{V}_{\mathrm{SS}}$ or $\mathrm{V}_{\mathrm{DD}}$, but the input current may increase.
The one-channel MCP6S91 has approximately the same input bias current as the two-channel MCP6S92 and MCP6S93.
The input offset voltage mismatch between channels $\left(\Delta \mathrm{V}_{\text {OS }}\right)$ is, ideally, $0 \mu \mathrm{~V}$. The input MUX uses CMOS transmission gates that have drain-source (channel) resistance, but no offset voltage. The histogram in Figure 2-8 reflects the measurement repeatability (i.e., noise power bandwidth) rather than the actual mismatch. Reducing the measurement bandwidth will produce a more narrow histogram and give an average closer to $0 \mu \mathrm{~V}$.

### 4.2 Internal Op Amp

The internal op amp gives the right combination of bandwidth, accuracy and flexibility.

### 4.2.1 COMPENSATION CAPACITORS

The internal op amp has three compensation capacitors (comp. caps.) connected to a switching network. They are selected to give good small-signal bandwidth at high gains and good slew rates (full-power bandwidth) at low gains. The change in bandwidth as gain changes is between 2 and 12 MHz . Refer to Table 4-1 for more information.

## TABLE 4-1: GAIN VS. INTERNAL COMPENSATION CAPACITOR

| Gain <br> (V/V) | Internal <br> Comp. <br> Cap. | GBWP <br> $(\mathbf{M H z})$ <br> Typ. | SR <br> $(\mathbf{V / \mu s})$ <br> Typ. | FPBW <br> (MHz) <br> Typ. | BW <br> (MHz) <br> Typ. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Large | 12 | 4.0 | 0.30 | 12 |
| 2 | Large | 12 | 4.0 | 0.30 | 6 |
| 4 | Medium | 20 | 11 | 0.70 | 10 |
| 5 | Medium | 20 | 11 | 0.70 | 7 |
| 8 | Medium | 20 | 11 | 0.70 | 2.4 |
| 10 | Medium | 20 | 11 | 0.70 | 2.0 |
| 16 | Small | 64 | 22 | 1.6 | 5 |
| 32 | Small | 64 | 22 | 1.6 | 2.0 |

Note 1: FPBW is the Full-Power Bandwidth.
These numbers are based on $V_{D D}=5.0 \mathrm{~V}$.
2: No changes in DC performance (e.g., $\mathrm{V}_{\mathrm{OS}}$ ) accompany a change in compensation capacitor.
3: $B W$ is the closed-loop, small signal -3 dB bandwidth.

### 4.2.2 RAIL-TO-RAIL CHANNEL INPUTS

The input stage of the internal op amp uses two differential input stages in parallel; one operates at low $\mathrm{V}_{\mathrm{IN}}$ (input voltage), while the other operates at high $\mathrm{V}_{\mathrm{IN}}$. With this topology, the internal inputs can operate to 0.3 V past either supply rail. The input offset voltage is measured at both $\mathrm{V}_{\mathrm{IN}}=\mathrm{V}_{\mathrm{SS}}-0.3 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ to ensure proper operation.

The transition between the two input stages occurs when $\mathrm{V}_{\mathrm{IN}} \approx \mathrm{V}_{\mathrm{DD}}-1.5 \mathrm{~V}$. For the best distortion and gain linearity, avoid this region of operation.

### 4.2.3 RAIL-TO-RAIL OUTPUT

The maximum output voltage swing is the maximum swing possible under a particular amplifier load current. The amplifier load current is the sum of the external load current (lout) and the current through the ladder resistance (llad); see Figure 4-2.

## EQUATION 4-1:

$$
\text { Amplifier Load Current }=I_{O U T}+I_{L A D}
$$

Where:

$$
I_{L A D}=\frac{\left(V_{O U T}-V_{R E F}\right)}{R_{L A D}}
$$

FIGURE 4-2: Amplifier Load Current.
See Figure 2-21 for the typical output headroom $\left(\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{\mathrm{OH}}\right.$ or $\mathrm{V}_{\mathrm{OL}}-\mathrm{V}_{\mathrm{SS}}$ ) as a function of amplifier load current.
The specification table states the output can reach within 60 mV of either supply rail when $R_{L}=10 \mathrm{k} \Omega$ and $V_{R E F}=V_{D D} / 2$.

### 4.2.4 INPUT VOLTAGE AND PHASE REVERSAL

The MCP6S91/2/3 amplifier family is designed with CMOS input devices. It is designed to not exhibit phase inversion when the input pins exceed the supply voltages. Figure 2-29 shows an input voltage exceeding both supplies with no resulting phase inversion.

The maximum voltage that can be applied to the input pins ( CHx ) is $\mathrm{V}_{\mathrm{SS}}-0.3 \mathrm{~V}$ to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. Voltages on the inputs that exceed this absolute maximum rating can cause excessive current to flow into or out of the input pins. Current beyond $\pm 2 \mathrm{~mA}$ can cause possible reliability problems. Applications that exceed this rating must be externally limited with an input resistor, as shown in Figure 4-3.

FIGURE 4-3: $\quad R_{I N}$ limits the current flow into an input pin.

### 4.3 Resistor Ladder

The resistor ladder shown in Figure 4-1 ( $R_{L A D}=R_{F}+R_{G}$ ) sets the gain. Placing the gain switches in series with the inverting input reduces the parasitic capacitance, distortion and gain mismatch.
$R_{\text {LAD }}$ is an additional load on the output of the PGA and causes additional current draw from the supplies. It is also a load ( $\mathrm{Z}_{\mathrm{IN}_{\mathrm{R}} \mathrm{REF}}$ ) on the external circuitry driving the $V_{\text {REF }}$ pin.
In Shutdown mode, $R_{\text {LAD }}$ is still attached to the $V_{\text {OUT }}$ and $\mathrm{V}_{\text {REF }}$ pins. Thus, these pins and the internal amplifier's inverting input are all connected through $R_{\text {LAD }}$ and the output is not High-Z (unlike the internal op amp).
While $R_{\text {LAD }}$ contributes to the output noise, its effect is small. Refer to Figure 2-12.

### 4.4 Rail-to-Rail $\mathrm{V}_{\text {REF }}$ Input

The $\mathrm{V}_{\text {REF }}$ input is intended to be driven by a lowimpedance voltage source. The source driving the $\mathrm{V}_{\text {REF }}$ pin should have an output impedance less than $0.1 \Omega$ to maintain reasonable gain accuracy. The supply voltage $V_{S S}$ and $V_{D D}$ usually meet this requirement.
$R_{\text {LAD }}$ presents a load at the $V_{\text {REF }}$ pin to the external circuit $\left(Z_{\text {IN_REF }} \approx(5 \mathrm{k} \Omega / \mathrm{G})| |(6 \mathrm{pF})\right)$, which depends on the gain. Āny source driving the $\mathrm{V}_{\text {REF }}$ pin must be capable of driving a load as heavy as $0.16 \mathrm{k} \Omega \| 6 \mathrm{pF}$ ( $\mathrm{G}=32$ ).
The absolute maximum voltages that can be applied to the reference input pin ( $\mathrm{V}_{\mathrm{REF}}$ ) are $\mathrm{V}_{\mathrm{SS}}-0.3 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$. Voltages on the inputs that exceed this absolute maximum rating can cause excessive current to flow into or out of this pin. Current beyond $\pm 2 \mathrm{~mA}$ can cause possible reliability problems. Because an external series resistor cannot be used (for low gain error), the external circuit must ensure that $\mathrm{V}_{\text {REF }}$ is between $\mathrm{V}_{\mathrm{SS}}-0.3 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$.
The $V_{\text {IVR REF }}$ spec shows the region of normal operation for the $\mathrm{V}_{\text {REF }}$ pin ( $\mathrm{V}_{\mathrm{SS}}$ to $\mathrm{V}_{\mathrm{DD}}$ ). Staying within this region ensures proper operation of the PGA and its surrounding circuitry.

### 4.5 Shutdown Mode

These PGAs use a software shutdown command. When the SPI interface sends a shutdown command, the internal op amp is shut down and its output placed in a High-Z state.
The resistive ladder is always connected between $\mathrm{V}_{\text {REF }}$ and $\mathrm{V}_{\text {OUT; }}$, even in shutdown. This means that the output resistance will be on the order of $5 \mathrm{k} \Omega$, with a path for output signals to appear at the input.

### 5.0 DIGITAL FUNCTIONS

The MCP6S91/2/3 PGAs use a standard SPI compatible serial interface to receive instructions from a controller. This interface is configured to allow daisychaining with other SPI devices.

### 5.1 SPI Timing

Chip Select ( $\overline{\mathrm{CS}}$ ) toggles low to initiate communication with these devices. The first byte of each SI word (two bytes long) is the instruction byte, which goes into the Instruction register. The Instruction register points the second byte to its destination. In a typical application, $\overline{\mathrm{CS}}$ is raised after one word (16 bits) to implement the desired changes. Section 5.3 "Daisy-

Chain Configuration", covers applications using multiple 16-bit words. SO goes low after $\overline{\mathrm{CS}}$ goes high; it has a push-pull output that does not go into a high-Z state.
The MCP6S91/2/3 devices operate in SPI modes 0,0 and 1,1. In 0,0 mode, the clock idles in the low state (Figure 5-1). In 1,1 mode, the clock idles in the high state (Figure 5-2). In both modes, SI data is loaded into the PGA on the rising edge of SCK, while SO data is clocked out on the falling edge of SCK. In 0,0 mode, the falling edge of $\overline{\mathrm{CS}}$ also acts as the first falling edge of SCK (see Figure 5-1). There must be multiples of 16 clocks (SCK) while $\overline{\mathrm{CS}}$ is low or commands will abort (see Section 5.3 "Daisy-Chain Configuration").

FIGURE 5-1: $\quad$ Serial Bus Sequence for the PGA; SPITM 0,0 Mode (see Figure 1-4).

FIGURE 5-2: $\quad$ Serial Bus Sequence for the PGA; SPITM 1,1 Mode (see Figure 1-5).

### 5.2 Registers

The analog functions are programmed through the SPI interface using 16-bit words (see Figure 5-1 and Figure 5-2). This data is sent to two of three 8-bit registers: Instruction register (Register 5-1), Gain register (Register 5-2) and Channel register (Register 5-3). There are no power-up defaults for these three registers.

### 5.2.1 ENSURING VALID DATA IN THE REGISTERS

After power up, the registers contain random data that must be initialized. Sending valid gain and channel selection commands to the internal registers puts valid data into those registers. Also, the internal state machine starts in an arbitrary state. Toggling the Chip Select pin ( $\overline{\mathrm{CS}}$ ) from high to low, then back to high again, puts the internal state machine in a known, valid condition (this can be done by entering any valid command).

After power-up, and when the power supply voltage dips below the minimum valid $\mathrm{V}_{\mathrm{DD}}\left(\mathrm{V}_{\mathrm{DD}}\right.$ VAL $)$, the internal register data and state machine may need to be reset. This is accomplished as described before. Use an external system supervisor to detect these events so that the microcontroller will reset the PGA state and registers.
A $0.1 \mu \mathrm{~F}$ bypass capacitor mounted as close as possible to the $\mathrm{V}_{\mathrm{DD}}$ pin provides additional transient immunity.

### 5.2.2 INSTRUCTION REGISTER

The Instruction register has 3 command bits and 1 indirect address bit; see Register 5-1. The command bits include a NOP (000) to support daisy-chaining (see Section 5.3 "Daisy-Chain Configuration"); the other NOP commands shown should not be used (they are reserved for future use). The device is brought out of Shutdown mode when a valid command, other than NOP or Shutdown, is sent and $\overline{\mathrm{CS}}$ is raised.

## REGISTER 5-1: INSTRUCTION REGISTER

| W-0 | W-0 | W-0 | U-x | U-x | U-x | U-x | W-0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M2 | M1 | M0 | - | - | - | - | A0 |
| bit 7 |  |  |  |  |  |  |  |

| bit 7-5 | M2-M0: Command bits |
| :---: | :---: |
|  | $000=\operatorname{NOP}$ (Note 1) |
|  | $001=$ PGA enters Shutdown mode as soon as a full 16 -bit word is sent and $\overline{C S}$ is raised. (Notes 1 and 2) |
|  | $010=$ Write to register. |
|  | $011=$ NOP (reserved for future use) (Note 1) |
|  | $1 \mathrm{xX}=\mathrm{NOP}$ (reserved for future use) (Note 1) |
| bit 4-1 | Unimplemented: Read as '0' (reserved for future use) |
| bit 0 | A0: Indirect Address bit |
|  | $1=$ Addresses the Channel register |
|  | $0=$ Addresses the Gain register |

Note 1: All other bits in the 16-bit word (including A0) are "don't cares."
2: The device exits Shutdown mode when a valid command (other than NOP or Shutdown) is sent and $\overline{C S}$ is raised; that valid command will be executed. Shutdown does not toggle.

| $-n=$ Value at POR | $' 1$ ' $=$ Bit is set | ' 0 ' $=$ Bit is cleared $\quad x=$ Bit is unknown |

### 5.2.3 SETTING THE GAIN

The amplifier can be programmed to produce binary and decimal gain settings between $+1 \mathrm{~V} / \mathrm{V}$ and $+32 \mathrm{~V} / \mathrm{V}$. Register 5-2 shows the details. At the same time, different compensation capacitors are selected to optimize the bandwidth vs. slew rate trade-off (see Table 4-1).

REGISTER 5-2: GAIN REGISTER

### 5.2.4 CHANGING THE CHANNEL

If the Instruction register is programmed to address the
Channel register, the multiplexed inputs of the
MCP6S92 and MCP6S93 can be changed using
Register 5-3.

## REGISTER 5-3: CHANNEL REGISTER

bit 7-1 Unimplemented: Read as '0' (reserved for future use)
bit $0 \quad$ C0: Channel Select bit

|  | MCP6S91 | MCP6S92 | MCP6S93 |
| :--- | :--- | :--- | :--- |
| $0=$ | CH0 | CH0 | CH0 |
| $1=$ | CH 0 | CH 1 | CH 1 |

| Legend: |  |  |
| :--- | :--- | :--- |
| $R=$ Readable bit | $W=$ Writable bit | $U=$ Unimplemented bit, read as ' 0 ' |
| $-n=$ Value at POR | $' 1 '=$ Bit is set | $' 0$ ' = Bit is cleared $\quad x=$ Bit is unknown |

### 5.2.5 SHUTDOWN COMMAND

The software shutdown command allows the user to put the amplifier into a low-power mode (see Register 5-1). In this Shutdown mode, most pins are high-impedance (Section 4.5 "Shutdown Mode" and Section 5.1 "SPI Timing" cover the exceptions at pins $\mathrm{V}_{\text {REF, }} \mathrm{V}_{\text {OUT }}$ and SO).
Once the PGA has entered Shutdown mode, it will remain in this mode until either a valid command is sent to the device (other than NOP or Shutdown) or the device is powered down and back up again. The internal registers maintain their values while in shutdown.

Once brought out of Shutdown mode, the part returns to its previous state (see Section 5.2.1 "Ensuring Valid Data in the Registers" for exceptions to this rule). This makes it possible to bring the device out of shutdown mode using one command; send a command to select the current channel (or gain) and the device will exit shutdown with the same state that existed before shutdown.

### 5.3 Daisy-Chain Configuration

Multiple MCP6S91/2/3 devices can be connected in a daisy-chain configuration by connecting the SO pin from one device to the SI pin on the next device and using common SCK and $\overline{\mathrm{CS}}$ lines (Figure 5-3). This approach reduces PCB layout complexity and uses fewer PICmicro ${ }^{\circledR}$ microcontroller I/O pins.

The example in Figure 5-3 shows a daisy-chain configuration with two devices, although any number of devices can be configured this way. The MCP6S91 and MCP6S92 can only be used at the far end of the daisychain, because they do not have a serial data out (SO) pin. As shown in Figure 5-4 and Figure 5-5, both SI and SO data are sent in 16-bit (2 byte) words. These devices abort any command that is not a multiple of 16 bits.
When using the daisy-chain configuration, the maximum clock speed possible is reduced to $\approx 5.8 \mathrm{MHz}$ due to the SO pin's propagation delay (see Electrical Specifications).
The internal SPI shift register is automatically loaded with zeros whenever $\overline{\mathrm{CS}}$ goes high (a command is executed). Thus, the first 16 -bits out of the SO pin after the $\overline{\mathrm{CS}}$ line goes low are always zeros. This means that the first command loaded into the next device in the daisy-chain is a NOP. This feature makes it possible to send shorter command and data byte strings when the farthest devices do not need to change. For example, if there were three devices on the chain, and only the middle device needed changing, then only 32 bytes of data need to be transmitted (for the first and middle devices). The last device on the chain would receive a NOP when the $\overline{\mathrm{CS}}$ pin is raised to execute the command.

FIGURE 5-3: Daisy-Chain Configuration.
