

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Miniature Single-Cell, Fully Integrated Li-Ion, Li-Polymer Charge Management Controllers

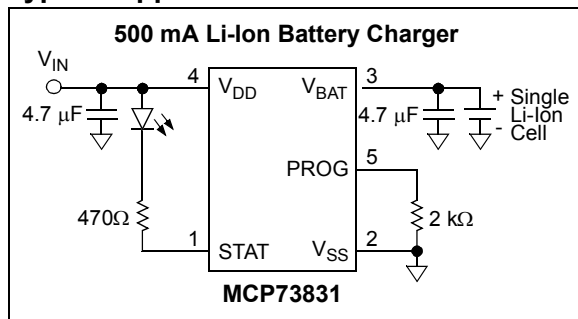

### Features:

- Linear Charge Management Controller:
  - Integrated Pass Transistor
  - Integrated Current Sense
  - Reverse Discharge Protection
- High Accuracy Preset Voltage Regulation:  $\pm 0.75\%$
- Four Voltage Regulation Options:
  - 4.20V, 4.35V, 4.40V, 4.50V
- Programmable Charge Current: 15 mA to 500 mA
- Selectable Preconditioning:
  - 10%, 20%, 40%, or Disable
- Selectable End-of-Charge Control:
  - 5%, 7.5%, 10%, or 20%
- Charge Status Output
  - Tri-State Output - MCP73831
  - Open-Drain Output - MCP73832
- Automatic Power-Down
- Thermal Regulation
- Temperature Range:  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$
- Packaging:
  - 8-Lead, 2 mm x 3 mm DFN
  - 5-Lead, SOT-23

### Applications:

- Lithium-Ion/Lithium-Polymer Battery Chargers
- Personal Data Assistants
- Cellular Telephones
- Digital Cameras
- MP3 Players
- Bluetooth Headsets
- USB Chargers

### Typical Application

### Description:

The MCP73831/2 devices are highly advanced linear charge management controllers for use in space-limited, cost-sensitive applications. The MCP73831/2 are available in an 8-Lead, 2 mm x 3 mm DFN package or a 5-Lead, SOT-23 package. Along with their small physical size, the low number of external components required make the MCP73831/2 ideally suited for portable applications. For applications charging from a USB port, the MCP73831/2 adhere to all the specifications governing the USB power bus.

The MCP73831/2 employ a constant-current/constant-voltage charge algorithm with selectable preconditioning and charge termination. The constant regulation is fixed with four available options: 4.20V, 4.35V, 4.40V or 4.50V, to accommodate new, emerging battery charging requirements. The constant current value is set with one external resistor. The MCP73831/2 devices limit the charge current based on die temperature during high power or high ambient conditions. This thermal regulation optimizes the charge cycle time while maintaining device reliability.

Several options are available for the preconditioning threshold, preconditioning current value, charge termination value and automatic recharge threshold. The preconditioning value and charge termination value are set as a ratio or percentage of the programmed constant current value. Preconditioning can be disabled. Refer to [Section 1.0 "Electrical Characteristics"](#) for available options and the [Product Identification System](#) for standard options.

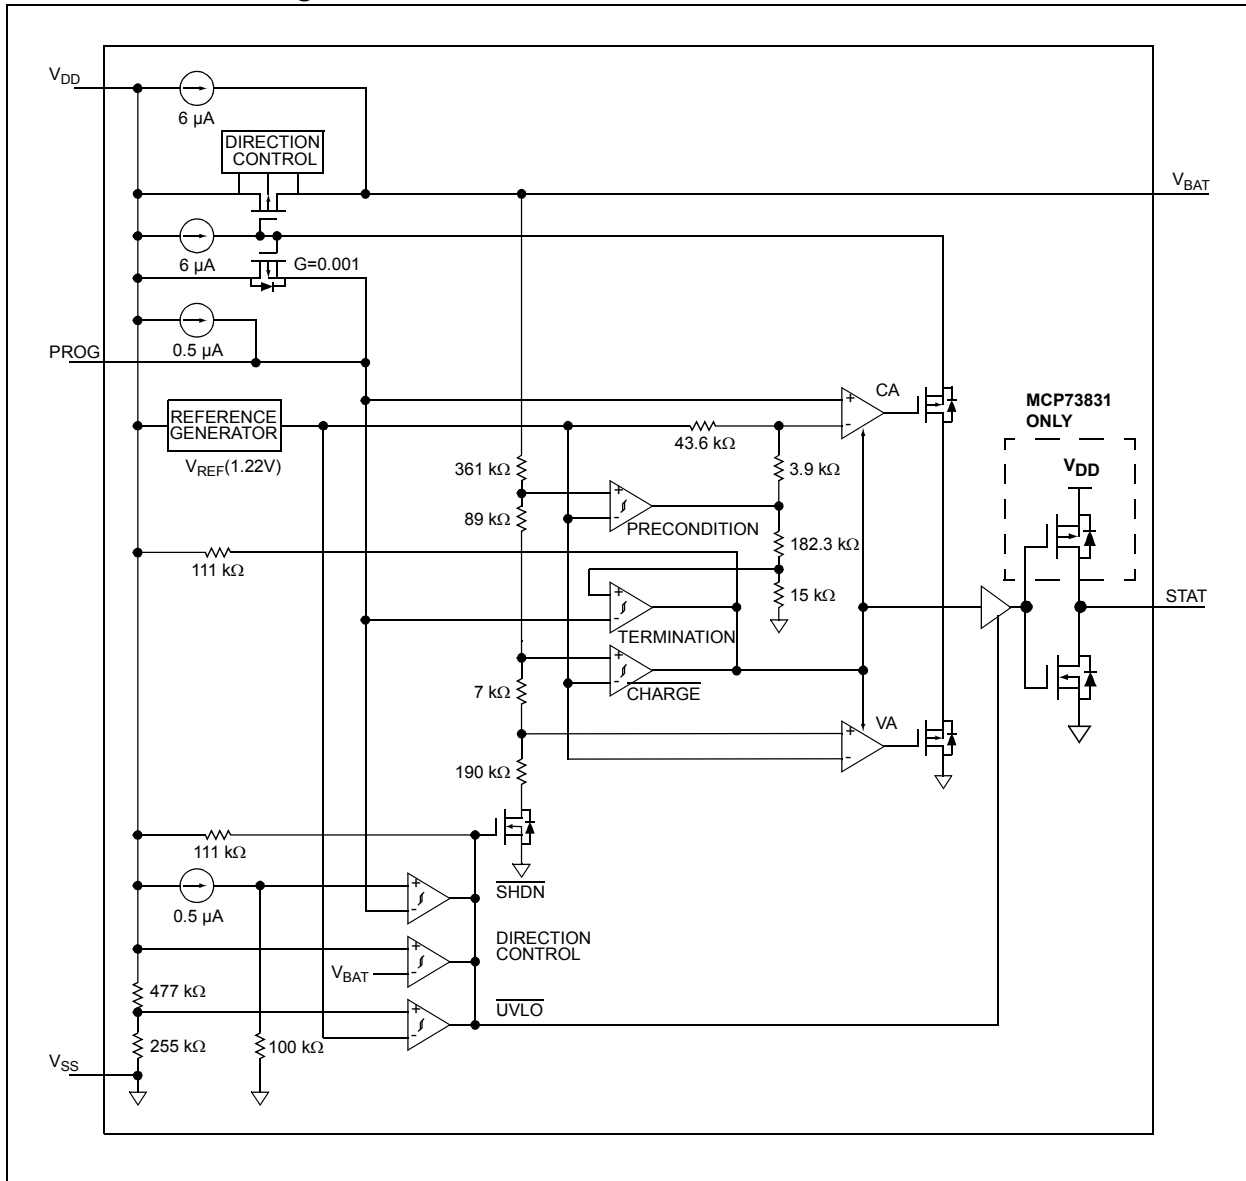

The MCP73831/2 devices are fully specified over the ambient temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ .

### Package Types

# MCP73831/2

## Functional Block Diagram

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings†

$V_{DD}$  ..... 7.0V  
 All Inputs and Outputs w.r.t.  $V_{SS}$  ..... -0.3 to ( $V_{DD}+0.3$ )V  
 Maximum Junction Temperature,  $T_J$  ..... Internally Limited  
 Storage temperature ..... -65°C to +150°C  
 ESD protection on all pins:  
 Human Body Model (1.5 k $\Omega$  in Series with 100 pF) .....  $\geq 4$  kV  
 Machine Model (200 pF, No Series Resistance) ..... 400V

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

### DC CHARACTERISTICS

**Electrical Specifications:** Unless otherwise indicated, all limits apply for  $V_{DD} = [V_{REG}(\text{typical}) + 0.3V]$  to 6V,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ . Typical values are at  $+25^\circ\text{C}$ ,  $V_{DD} = [V_{REG}(\text{typical}) + 1.0V]$

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
<b>Supply Input</b>						
Supply Voltage	$V_{DD}$	3.75	—	6	V	
Supply Current	$I_{SS}$	—	510	1500	$\mu\text{A}$	Charging
		—	53	200	$\mu\text{A}$	Charge Complete, No Battery
		—	25	50	$\mu\text{A}$	PROG Floating
		—	1	5	$\mu\text{A}$	$V_{DD} \leq (V_{BAT} - 50 \text{ mV})$
		—	0.1	2	$\mu\text{A}$	$V_{DD} < V_{STOP}$
UVLO Start Threshold	$V_{START}$	3.3	3.45	3.6	V	$V_{DD}$ Low-to-High
UVLO Stop Threshold	$V_{STOP}$	3.2	3.38	3.5	V	$V_{DD}$ High-to-Low

**Note 1:** Not production tested. Ensured by design.

## DC CHARACTERISTICS (CONTINUED)

**Electrical Specifications:** Unless otherwise indicated, all limits apply for  $V_{DD} = [V_{REG}(\text{typical}) + 0.3V]$  to 6V,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ . Typical values are at  $+25^\circ\text{C}$ ,  $V_{DD} = [V_{REG}(\text{typical}) + 1.0V]$

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
Automatic Power Down Exit Threshold	$V_{PDEXIT}$	—	$V_{DD} < (V_{BAT} + 150 \text{ mV})$	$V_{DD} < (V_{BAT} + 200 \text{ mV})$		$3.5V \leq V_{BAT} \leq V_{REG}$ $V_{DD}$ Rising
<b>Thermal Shutdown</b>						
Die Temperature	$T_{SD}$	—	150	—	$^\circ\text{C}$	
Die Temperature Hysteresis	$T_{SDHYS}$	—	10	—	$^\circ\text{C}$	

**Note 1:** Not production tested. Ensured by design.

## AC CHARACTERISTICS

**Electrical Specifications:** Unless otherwise indicated, all limits apply for  $V_{DD} = [V_{REG}(\text{typical}) + 0.3V]$  to 12V,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ . Typical values are at  $+25^\circ\text{C}$ ,  $V_{DD} = [V_{REG}(\text{typical}) + 1.0V]$

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
UVLO Start Delay	$t_{START}$	—	—	5	ms	$V_{DD}$ Low-to-High
<b>Constant-Current Regulation</b>						
Transition Time Out of Preconditioning	$t_{DELAY}$	—	—	1	ms	$V_{BAT} < V_{PTH}$ to $V_{BAT} > V_{PTH}$
Current Rise Time Out of Preconditioning	$t_{RISE}$	—	—	1	ms	$I_{OUT}$ Rising to 90% of $I_{REG}$
Termination Comparator Filter	$t_{TERM}$	0.4	1.3	3.2	ms	Average $I_{OUT}$ Falling
Charge Comparator Filter	$t_{CHARGE}$	0.4	1.3	3.2	ms	Average $V_{BAT}$
<b>Status Indicator</b>						
Status Output turn-off	$t_{OFF}$	—	—	200	$\mu\text{s}$	$I_{SINK} = 1 \text{ mA to } 0 \text{ mA}$
Status Output turn-on	$t_{ON}$	—	—	200	$\mu\text{s}$	$I_{SINK} = 0 \text{ mA to } 1 \text{ mA}$

## TEMPERATURE SPECIFICATIONS

**Electrical Specifications:** Unless otherwise indicated, all limits apply for  $V_{DD} = [V_{REG}(\text{typical}) + 0.3V]$  to 12V. Typical values are at  $+25^\circ\text{C}$ ,  $V_{DD} = [V_{REG}(\text{typical}) + 1.0V]$

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
<b>Temperature Ranges</b>						
Specified Temperature Range	$T_A$	-40	—	+85	$^\circ\text{C}$	
Operating Temperature Range	$T_J$	-40	—	+125	$^\circ\text{C}$	
Storage Temperature Range	$T_A$	-65	—	+150	$^\circ\text{C}$	
<b>Thermal Package Resistances</b>						
5-Lead, SOT-23	$\theta_{JA}$	—	230	—	$^\circ\text{C/W}$	4-Layer JC51-7 Standard Board, Natural Convection ( <b>Note 2</b> )
8-Lead, 2 mm x 3 mm, DFN	$\theta_{JA}$	—	76	—	$^\circ\text{C/W}$	4-Layer JC51-7 Standard Board, Natural Convection ( <b>Note 1</b> )

**Note 1:** This represents the minimum copper condition on the PCB (Printed Circuit Board).

**2:** With large copper area on the PCB, the SOT-23-5 thermal resistance ( $\theta_{JA}$ ) can reach a typical value of  $130^\circ\text{C/W}$  or better.

# MCP73831/2

NOTES:

### 3.0 PIN DESCRIPTION

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLES**

Pin No.		Symbol	Function
DFN	SOT-23-5		
1	4	$V_{DD}$	Battery Management Input Supply
2	—	$V_{DD}$	Battery Management Input Supply
3	3	$V_{BAT}$	Battery Charge Control Output
4	—	$V_{BAT}$	Battery Charge Control Output
5	1	STAT	Charge Status Output
6	2	$V_{SS}$	Battery Management 0V Reference
7	—	NC	No Connection
8	5	PROG	Current Regulation Set and Charge Control Enable
9	—	EP	Exposed Thermal Pad (EP); must be connected to $V_{SS}$ .

#### 3.1 Battery Management Input Supply ( $V_{DD}$ )

A supply voltage of [ $V_{REG}$  (typical) + 0.3V] to 6V is recommended. Bypass to  $V_{SS}$  with a minimum of 4.7  $\mu$ F.

#### 3.2 Battery Charge Control Output ( $V_{BAT}$ )

Connect to positive terminal of battery. Drain terminal of internal P-channel MOSFET pass transistor. Bypass to  $V_{SS}$  with a minimum of 4.7  $\mu$ F to ensure loop stability when the battery is disconnected.

#### 3.3 Charge Status Output (STAT)

STAT is an output for connection to an LED for charge status indication. Alternatively, a pull-up resistor can be applied for interfacing to a host microcontroller.

STAT is a tri-state logic output on the MCP73831 and an open-drain output on the MCP73832.

#### 3.4 Battery Management 0V Reference ( $V_{SS}$ )

Connect to negative terminal of battery and input supply.

#### 3.5 Current Regulation Set (PROG)

Preconditioning, fast charge and termination currents are scaled by placing a resistor from PROG to  $V_{SS}$ .

The charge management controller can be disabled by allowing the PROG input to float.

#### 3.6 Exposed Thermal Pad (EP)

An internal electrical connection exists between the Exposed Thermal Pad (EP) and the  $V_{SS}$  pin. They must be connected to the same potential on the Printed Circuit Board (PCB).

For better thermal performance, it is recommended to add vias from the land area of EP to a copper layer on the other side of the PCB.

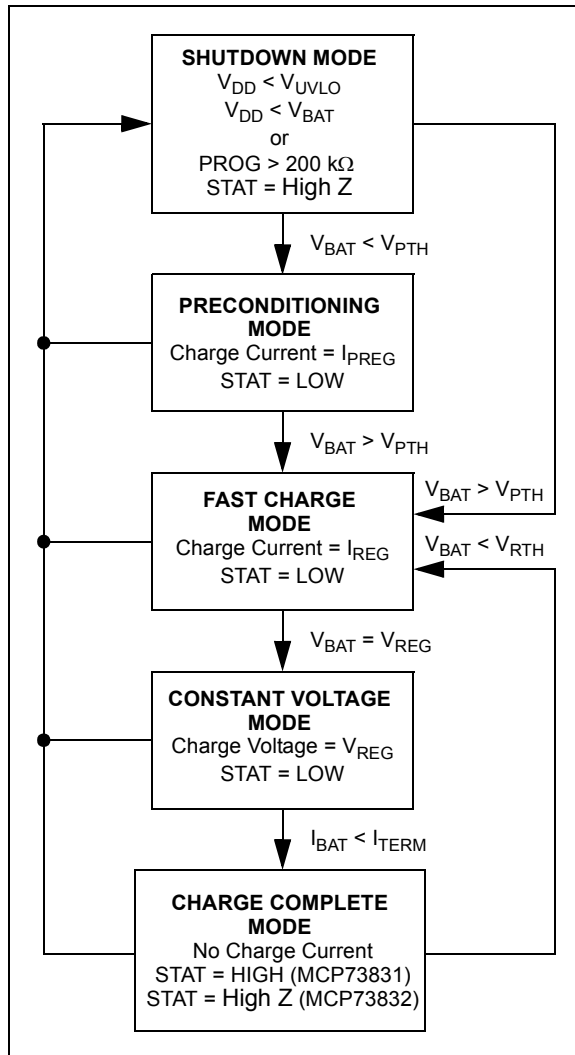

# MCP73831/2

---

NOTES:

## 4.0 DEVICE OVERVIEW

The MCP73831/2 are highly advanced linear charge management controllers. [Figure 4-1](#) depicts the operational flow algorithm from charge initiation to completion and automatic recharge.

**FIGURE 4-1:** Flowchart.

### 4.1 Undervoltage Lockout (UVLO)

An internal UVLO circuit monitors the input voltage and keeps the charger in Shutdown mode until the input supply rises above the UVLO threshold. The UVLO circuitry has a built in hysteresis of 100 mV.

In the event a battery is present when the input power is applied, the input supply must rise to a level 150 mV above the battery voltage before the MCP73831/2 become operational.

The UVLO circuit places the device in Shutdown mode if the input supply falls to within +50 mV of the battery voltage. Again, the input supply must rise to a level 150 mV above the battery voltage before the MCP73831/2 become operational.

The UVLO circuit is always active. Whenever the input supply is below the UVLO threshold or within +50 mV of the voltage at the  $V_{BAT}$  pin, the MCP73831/2 are placed in Shutdown mode.

During any UVLO condition, the battery reverse discharge current is less than 2  $\mu$ A.

### 4.2 Battery Detection

A 6  $\mu$ A (typical) current is sourced by the  $V_{BAT}$  pin to determine if a battery is present or not. If the voltage at  $V_{BAT}$  rises to  $V_{REG} + 100$  mV (typical), the device assumes that a battery is not present. If the voltage stays below  $V_{REG} + 100$  mV (typical), the device assumes that a battery is detected. In order to correctly detect a battery insertion, the impedance seen by the  $V_{BAT}$  pin before the battery is connected must be greater than 2 M $\Omega$ .

### 4.3 Charge Qualification

For a charge cycle to begin, all UVLO conditions must be met and a battery or output load must be present. A charge current programming resistor must be connected from PROG to  $V_{SS}$ . If the PROG pin is open or floating, the MCP73831/2 are disabled and the battery reverse discharge current is less than 2  $\mu$ A. In this manner, the PROG pin acts as a charge enable and can be used as a manual shutdown.

### 4.4 Preconditioning

If the voltage at the  $V_{BAT}$  pin is less than the preconditioning threshold, the MCP73831/2 enter a preconditioning or Trickle Charge mode. The preconditioning threshold is factory set. Refer to [Section 1.0 “Electrical Characteristics”](#) for preconditioning threshold options and the [Product Identification System](#) for standard options.

In this mode, the MCP73831/2 supply a percentage of the charge current (established with the value of the resistor connected to the PROG pin) to the battery. The percentage or ratio of the current is factory set. Refer to [Section 1.0 “Electrical Characteristics”](#) for preconditioning current options and the [Product Identification System](#) for standard options.

When the voltage at the  $V_{BAT}$  pin rises above the preconditioning threshold, the MCP73831/2 enter the Constant-Current or Fast Charge mode.

# MCP73831/2

## 4.5 Fast Charge Constant-Current Mode

During the Constant-Current mode, the programmed charge current is supplied to the battery or load. The charge current is established using a single resistor from PROG to  $V_{SS}$ . Constant-Current mode is maintained until the voltage at the  $V_{BAT}$  pin reaches the regulation voltage,  $V_{REG}$ .

## 4.6 Constant-Voltage Mode

When the voltage at the  $V_{BAT}$  pin reaches the regulation voltage,  $V_{REG}$ , constant voltage regulation begins. The regulation voltage is factory set to 4.2V, 4.35V, 4.40V or 4.50V with a tolerance of  $\pm 0.75\%$ .

## 4.7 Charge Termination

The charge cycle is terminated when, during Constant-Voltage mode, the average charge current diminishes below a percentage of the programmed charge current (established with the value of the resistor connected to the PROG pin). A 1 ms filter time on the termination comparator ensures that transient load conditions do not result in premature charge cycle termination. The percentage or ratio of the current is factory set. Refer to [Section 1.0 “Electrical Characteristics”](#) for charge termination current options and the [Product Identification System](#) for standard options.

The charge current is latched off and the MCP73831/2 enter a Charge Complete mode.

## 4.8 Automatic Recharge

The MCP73831/2 continuously monitor the voltage at the  $V_{BAT}$  pin in the Charge Complete mode. If the voltage drops below the recharge threshold, another charge cycle begins and current is once again supplied to the battery or load. The recharge threshold is factory set. Refer to [Section 1.0 “Electrical Characteristics”](#) for recharge threshold options and the [Product Identification System](#) for standard options.

## 4.9 Thermal Regulation

The MCP73831/2 limit the charge current based on the die temperature. The thermal regulation optimizes the charge cycle time while maintaining device reliability. [Figure 4-2](#) depicts the thermal regulation for the MCP73831/2.

**FIGURE 4-2:** Thermal Regulation.

## 4.10 Thermal Shutdown

The MCP73831/2 suspend charge if the die temperature exceeds 150°C. Charging will resume when the die temperature has cooled by approximately 10°C.

## 5.0 DETAILED DESCRIPTION

### 5.1 Analog Circuitry

#### 5.1.1 BATTERY MANAGEMENT INPUT SUPPLY (V<sub>DD</sub>)

The V<sub>DD</sub> pin is the input supply pin for the MCP73831/2 devices. The MCP73831/2 automatically enter a Power-Down mode if the voltage on the V<sub>DD</sub> input falls below the UVLO voltage (V<sub>STOP</sub>). This feature prevents draining the battery pack when the V<sub>DD</sub> supply is not present.

#### 5.1.2 CURRENT REGULATION SET (PROG)

Fast charge current regulation can be scaled by placing a programming resistor (R<sub>PROG</sub>) from the PROG input to V<sub>SS</sub>. The program resistor and the charge current are calculated using the following equation:

$$I_{REG} = \frac{1000V}{R_{PROG}}$$

Where:

$$\begin{aligned} R_{PROG} &= \text{kOhms} \\ I_{REG} &= \text{milliampere} \end{aligned}$$

The preconditioning trickle charge current and the charge termination current are ratiometric to the fast charge current based on the selected device options.

#### 5.1.3 BATTERY CHARGE CONTROL OUTPUT (V<sub>BAT</sub>)

The battery charge control output is the drain terminal of an internal P-channel MOSFET. The MCP73831/2 provide constant current and voltage regulation to the battery pack by controlling this MOSFET in the linear region. The battery charge control output should be connected to the positive terminal of the battery pack.

### 5.2 Digital Circuitry

#### 5.2.1 STATUS INDICATOR (STAT)

The charge status output of the MCP73831 has three different states: High (H), Low (L), and High-Impedance (High Z). The charge status output of the MCP73832 is open-drain. It has two different states: Low (L) and High-Impedance (High Z). The charge status output can be used to illuminate one, two or tri-color LEDs. Optionally, the charge status output can be used as an interface to a host microcontroller.

Table 5-1 summarizes the state of the status output during a charge cycle.

**TABLE 5-1: STATUS OUTPUT**

Charge Cycle State	STAT1	
	MCP73831	MCP73832
Shutdown	High Z	High Z
No Battery Present	High Z	High Z
Preconditioning	L	L
Constant-Current Fast Charge	L	L
Constant Voltage	L	L
Charge Complete – Standby	H	High Z

#### 5.2.2 DEVICE DISABLE (PROG)

The current regulation set input pin (PROG) can be used to terminate a charge at any time during the charge cycle, as well as to initiate a charge cycle or initiate a recharge cycle.

Placing a programming resistor from the PROG input to V<sub>SS</sub> enables the device. Allowing the PROG input to float or by applying a logic-high input signal, disables the device and terminates a charge cycle. When disabled, the device's supply current is reduced to 25 μA, typically.

# MCP73831/2

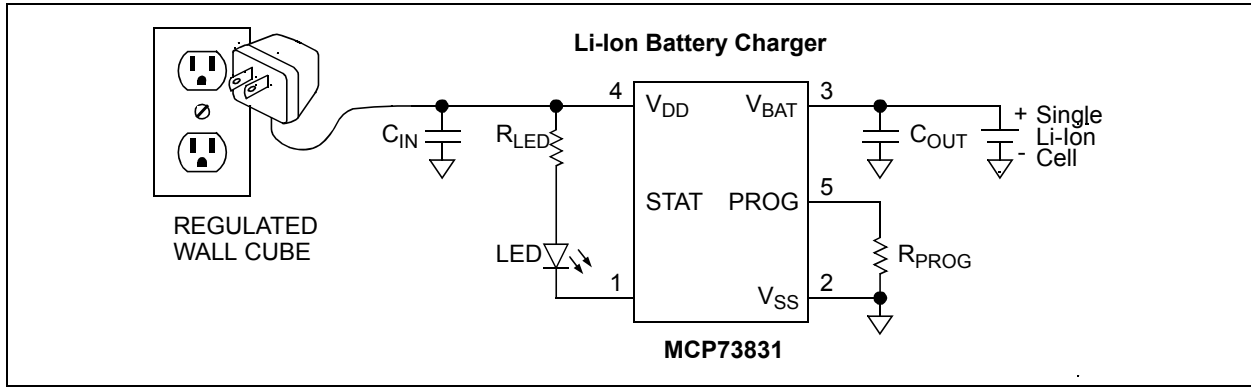

---

NOTES:

## 6.0 APPLICATIONS

The MCP73831/2 are designed to operate in conjunction with a host microcontroller or in a stand-alone application. The MCP73831/2 provide the preferred charge algorithm for Lithium-Ion and Lithium-Polymer cells. The algorithm uses a constant current

followed by a constant voltage charging method. [Figure 6-1](#) depicts a typical stand-alone application circuit, while [Figure 6-2](#) and [Figure 6-3](#) depict the accompanying charge profile.

**FIGURE 6-1:** Typical Application Circuit.

**FIGURE 6-2:** Typical Charge Profile (180 mAh Battery).

**FIGURE 6-3:** Typical Charge Profile in Thermal Regulation (1000 mAh Battery).

## 6.1 Application Circuit Design

Due to the low efficiency of linear charging, the most important factors are thermal design and cost, which are a direct function of the input voltage, output current and thermal impedance between the battery charger and the ambient cooling air. The worst-case situation is when the device has transitioned from the Preconditioning mode to the Constant-Current mode. In this situation, the battery charger has to dissipate the maximum power. A trade-off must be made between the charge current, cost and thermal requirements of the charger.

### 6.1.1 COMPONENT SELECTION

Selection of the external components in [Figure 6-1](#) is crucial to the integrity and reliability of the charging system. The following discussion is intended as a guide for the component selection process.

#### 6.1.1.1 Current Programming Resistor ( $R_{PROG}$ )

The preferred fast charge current for Lithium-Ion cells is at the 1C rate, with an absolute maximum current at the 2C rate. For example, a 500 mAh battery pack has a preferred fast charge current of 500 mA. Charging at this rate provides the shortest charge cycle times without degradation to the battery pack performance or life.

# MCP73831/2

## 6.1.1.2 Input Overvoltage Protection (IOVP)

Input overvoltage protection must be used when the input power source is hot-pluggable. This includes USB cables and Wall-type power supplies. The cabling of these supplies acts as an inductor. When the supplies are connected/disconnected from the system, large voltage transients are created which may damage the system circuitry. These transients should be snubbed out. A transzorb connected from the V+ input supply connector to the 0V ground reference will snub the transients.

## 6.1.1.3 Thermal Considerations

The worst-case power dissipation in the battery charger occurs when the input voltage is at the maximum and the device has transitioned from the Preconditioning mode to the Constant-Current mode. In this case, the power dissipation is:

$$PowerDissipation = (V_{DDMAX} - V_{PTHMIN}) \times I_{REGMAX}$$

Where:

- $V_{DDMAX}$  = the maximum input voltage
- $I_{REGMAX}$  = the maximum fast charge current
- $V_{PTHMIN}$  = the minimum transition threshold voltage

Power dissipation with a 5V,  $\pm 10\%$  input voltage source is:

$$PowerDissipation = (5.5V - 2.7V) \times 550mA = 1.54W$$

This power dissipation with the battery charger in the SOT-23-5 package will cause thermal regulation to be entered as depicted in [Figure 6-3](#). Alternatively, the 2mm x 3mm DFN package could be utilized to reduce charge cycle times.

## 6.1.1.4 External Capacitors

The MCP73831/2 are stable with or without a battery load. In order to maintain good AC stability in the Constant-Voltage mode, a minimum capacitance of 4.7  $\mu F$  is recommended to bypass the V<sub>BAT</sub> pin to V<sub>SS</sub>. This capacitance provides compensation when there is no battery load. In addition, the battery and interconnections appear inductive at high frequencies. These elements are in the control feedback loop during Constant-Voltage mode. Therefore, the bypass capacitance may be necessary to compensate for the inductive nature of the battery pack.

Virtually any good quality output filter capacitor can be used, independent of the capacitor's minimum Effective Series Resistance (ESR) value. The actual value of the capacitor (and its associated ESR) depends on the output load current. A 4.7  $\mu F$  ceramic, tantalum or aluminum electrolytic capacitor at the output is usually sufficient to ensure stability for output currents up to a 500 mA.

## 6.1.1.5 Reverse-Blocking Protection

The MCP73831/2 provide protection from a faulted or shorted input. Without the protection, a faulted or shorted input would discharge the battery pack through the body diode of the internal pass transistor.

## 6.1.1.6 Charge Inhibit

The current regulation set input pin (PROG) can be used to terminate a charge at any time during the charge cycle, as well as to initiate a charge cycle or initiate a recharge cycle.

Placing a programming resistor from the PROG input to V<sub>SS</sub> enables the device. Allowing the PROG input to float or by applying a logic-high input signal, disables the device and terminates a charge cycle. When disabled, the device's supply current is reduced to 25  $\mu A$ , typically.

## 6.1.1.7 Charge Status Interface

A status output provides information on the state of charge. The output can be used to illuminate external LEDs or interface to a host microcontroller. Refer to [Table 5-1](#) for a summary of the state of the status output during a charge cycle.

## 6.2 PCB Layout Issues

For optimum voltage regulation, place the battery pack as close as possible to the device's V<sub>BAT</sub> and V<sub>SS</sub> pins. This is recommended to minimize voltage drops along the high current-carrying PCB traces.

If the PCB layout is used as a heat sink, adding many vias in the heat sink pad can help conduct more heat to the PCB backplane, thus reducing the maximum junction temperature. [Figure 6-4](#) and [Figure 6-5](#) depict a typical layout with PCB heatsinking.

**FIGURE 6-4:** Typical Layout (Top).

**FIGURE 6-5:** Typical Layout (Bottom).

## 7.0 PACKAGING INFORMATION

### 7.1 Package Marking Information

8-Lead DFN (2x3x0.9 mm)

Device	Code
MCP73831T-2ACI/MC	AAE
MCP73831T-2ATI/MC	AAF
MCP73831T-2DCI/MC	AAG
MCP73831T-3ACI/MC	AAH
MCP73831T-4ADI/MC	AAJ
MCP73831T-5ACI/MC	AAK
MCP73832T-2ACI/MC	AAL
MCP73832T-2ATI/MC	AAM
MCP73832T-2DCI/MC	AAP
MCP73832T-3ACI/MC	AAQ
MCP73832T-4ADI/MC	AAR
MCP73832T-5ACI/MC	AAS

Example

**Note:** Applies to 8-Lead DFN

5-Lead SOT-23

Device	Code
MCP73831T-2ACI/OT	KDNN

## 8-Lead Plastic Dual Flat, No Lead Package (MC) – 2x3x0.9 mm Body [DFN]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

Dimension Limits	Units	MILLIMETERS		
		MIN	NOM	MAX
Number of Pins	N	8		
Pitch	e	0.50 BSC		
Overall Height	A	0.80	0.90	1.00
Standoff	A1	0.00	0.02	0.05
Contact Thickness	A3	0.20 REF		
Overall Length	D	2.00 BSC		
Overall Width	E	3.00 BSC		
Exposed Pad Length	D2	1.30	–	1.55
Exposed Pad Width	E2	1.50	–	1.75
Contact Width	b	0.20	0.25	0.30
Contact Length	L	0.30	0.40	0.50
Contact-to-Exposed Pad	K	0.20	–	–

**Notes:**

- Pin 1 visual index feature may vary, but must be located within the hatched area.
- Package may have one or more exposed tie bars at ends.
- Package is saw singulated.
- Dimensioning and tolerancing per ASME Y14.5M.

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-123C

## 8-Lead Plastic Dual Flat, No Lead Package (MC) - 2x3x0.9mm Body [DFN]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

RECOMMENDED LAND PATTERN

Dimension Limits	Units	MILLIMETERS		
		MIN	NOM	MAX
Contact Pitch	E	0.50 BSC		
Optional Center Pad Width	W2			1.45
Optional Center Pad Length	T2			1.75
Contact Pad Spacing	C1		2.90	
Contact Pad Width (X8)	X1			0.30
Contact Pad Length (X8)	Y1			0.75
Distance Between Pads	G	0.20

## APPENDIX A: REVISION HISTORY

### Revision G (July 2014)

The following is the list of modifications:

1. Updated the “**DC Characteristics**” table.
2. Added **Section 6.1.1.2 “Input Overvoltage Protection (IOVP)”**.

### Revision F (June 2013)

The following is the list of modifications:

3. Updated the **Functional Block Diagram**.
4. Added the Battery Detection parameter and related information in the “**DC Characteristics**” table.
5. Added new section **Section 4.2 “Battery Detection”**.
6. Minor grammatical and spelling corrections.

### Revision E (September 2008)

The following is the list of modifications:

1. **Package Types:** Changed DFN pinout diagram.
2. **Section 1.0 “Electrical Characteristics”:** Changed “Charge Impedance Range from 20 k $\Omega$  to 67 k $\Omega$ .”
3. **Section 1.0 “Electrical Characteristics”:** Misc. Formatting changes.
4. **Section 2.0 “Typical Performance Curves”:** Updated **Figure 2-4**.
5. **Section 3.0 “Pin Description”:** Added Exposed Pad pin to table and added **Section 3.6 “Exposed Thermal Pad (EP)”**.
6. Updated **Appendix A: “Revision History”**
7. Added Land Pattern Package Outline Drawing for 2x3 DFN package.

### Revision D (April 2008)

The following is the list of modifications:

1. Changed Charge Termination Current Ratio to 8.5% minimum and 11.5% maximum.

### Revision C (October 2007)

The following is the list of modifications:

1. Numerous edits throughout document.
2. Added note to the Temperature Specifications table.
3. Updated **Figure 2-4**.

### Revision B (March 2006)

The following is the list of modifications:

1. Added MCP73832 through document.

### Revision A (November 2005)

Original Release of this Document.

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.
