Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MCP7940N

Battery-Backed I²C™ Real-Time Clock/Calendar with SRAM

Timekeeping Features:

- Real-Time Clock/Calendar (RTCC):
  - Hours, Minutes, Seconds, Day of Week, Day, Month, Year
  - Leap year compensated to 2399
  - 12/24 hour modes
- Oscillator for 32.768 kHz Crystals:
  - Optimized for 6-9 pF crystals
- On-Chip Digital Trimming/Calibration:
  - ±1 PPM resolution
  - ±129 PPM range
- Dual Programmable Alarms
- Versatile Output Pin:
  - Clock output with selectable frequency
  - Alarm output
  - General purpose output
- Power-Fail Time-Stamp:
  - Time logged on switchover to and from Battery mode

Low-Power Features:

- Wide Voltage Range:
  - Operating voltage range of 1.8V to 5.5V
  - Backup voltage range of 1.3V to 5.5V
- Low Typical Timekeeping Current:
  - Operating from VCC: 1.2 µA at 3.3V
  - Operating from battery backup: 925 nA at 3.0V
- Automatic Switchover to Battery Backup

User Memory:

- 64-byte Battery-Backed SRAM

Operating Ranges:

- 2-Wire Serial Interface, I²C™ Compatible
  - I²C clock rate up to 400 kHz
- Temperature Range:
  - Industrial (I): -40°C to +85°C
  - Extended (E): -40°C to +125°C

Packages:

- 8-Lead SOIC, MSOP, TSSOP, PDIP and 2x3 TDFN

General Description:

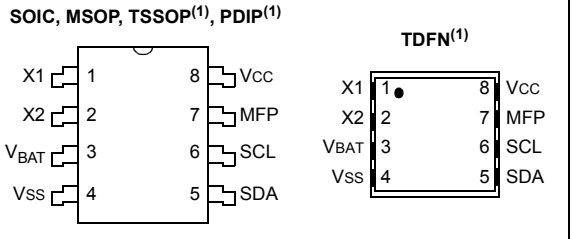
The MCP7940N Real-Time Clock/Calendar (RTCC) tracks time using internal counters for hours, minutes, seconds, days, months, years, and day of week. Alarms can be configured on all counters up to and including months. For usage and configuration, the MCP7940N supports I²C communications up to 400 kHz.

The open-drain, multi-functional output can be configured to assert on an alarm match, to output a selectable frequency square wave, or as a general purpose output.

The MCP7940N is designed to operate using a 32.768 kHz tuning fork crystal with external crystal load capacitors. On-chip digital trimming can be used to adjust for frequency variance caused by crystal tolerance and temperature.

SRAM and timekeeping circuitry are powered from the back-up supply when main power is lost, allowing the device to maintain accurate time and the SRAM contents. The times when the device switches over to the back-up supply and when primary power returns are both logged by the power-fail time-stamp.

Package Types



Note 1: Available in I-temp only.

FIGURE 1-1: TYPICAL APPLICATION SCHEMATIC

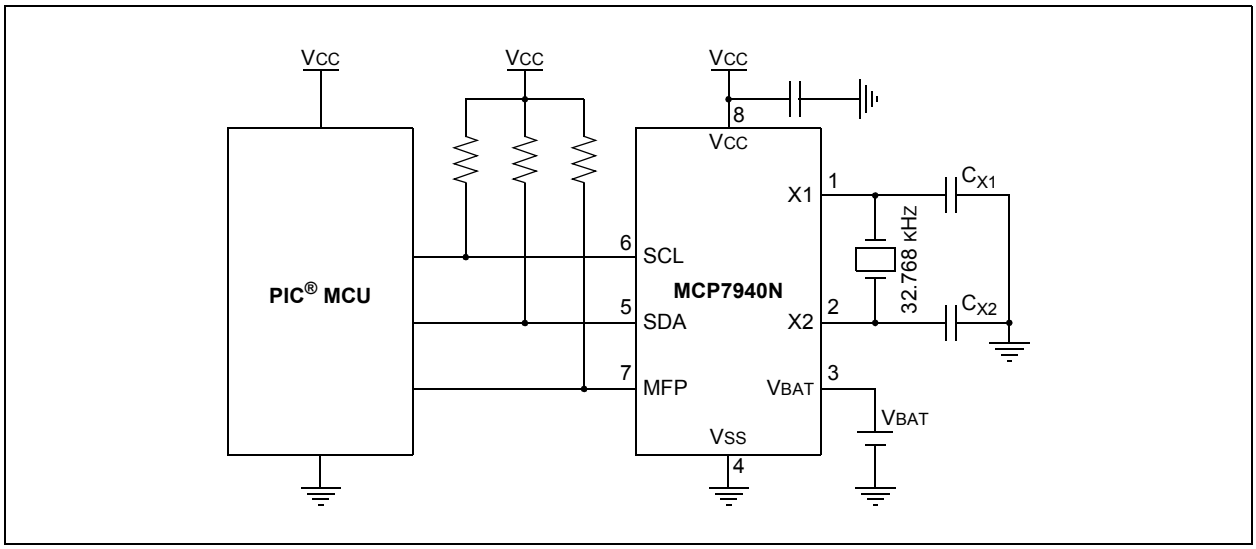


FIGURE 1-2: BLOCK DIAGRAM

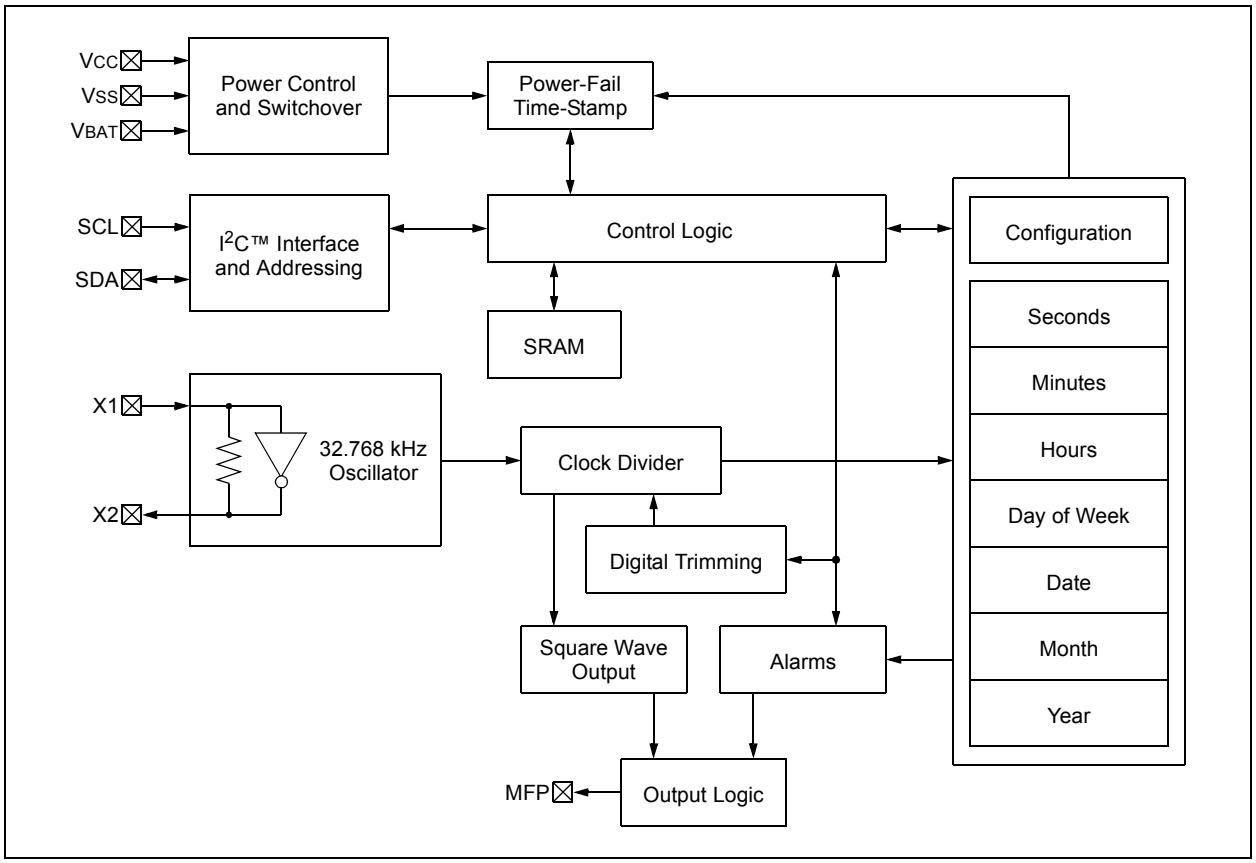

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings (†)

VCC.....6.5V

All inputs and outputs (except SDA and SCL) w.r.t. VSS.....-0.6V to VCC +1.0V

SDA and SCL w.r.t. VSS.....-0.6V to 6.5V

Storage temperature.....-65°C to +150°C

Ambient temperature with power applied.....-40°C to +125°C

ESD protection on all pins.....≥ 4 kV

† NOTICE: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

TABLE 1-1: DC CHARACTERISTICS

DC CHARACTERISTICS			**Electrical Characteristics:** Industrial (I): VCC = +1.8V to 5.5V TA = -40°C to +85°C; Extended (E): VCC = +1.8V to 5.5V TA = -40°C to +125°C

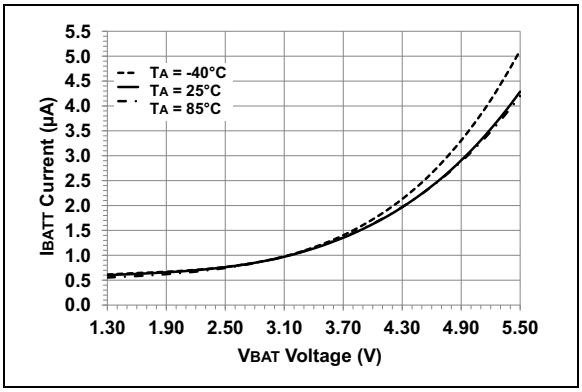
2.0 TYPICAL PERFORMANCE CURVE

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data represented may be outside the specified operating range (e.g., outside specified power supply range) and therefore, outside the warranted range.

FIGURE 2-1: TIMEKEEPING BACKUP CURRENT VS. BACKUP SUPPLY VOLTAGE



3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

Name	8-pin SOIC	8-pin MSOP	8-pin TSSOP	8-pin TDFN	8-pin PDIP	Function
X1	1	1	1	1	1	Quartz Crystal Input, External Oscillator Input
X2	2	2	2	2	2	Quartz Crystal Output
VBAT	3	3	3	3	3	Battery Backup Supply Input
Vss	4	4	4	4	4	Ground
SDA	5	5	5	5	5	Bidirectional Serial Data (I^2C™)
SCL	6	6	6	6	6	Serial Clock (I^2C)
MFP	7	7	7	7	7	Multifunction Pin
Vcc	8	8	8	8	8	Primary Power Supply

Note: Exposed pad on TFDN can be connected to Vss or left floating.

3.1 Serial Data (SDA)

This is a bidirectional pin used to transfer addresses and data into and out of the device. It is an open-drain terminal. Therefore, the SDA bus requires a pull-up resistor to VCC (typically 10 kΩ for 100 kHz, 2 kΩ for 400 kHz). For normal data transfer, SDA is allowed to change only during SCL low. Changes during SCL high are reserved for indicating the Start and Stop conditions.

3.2 Serial Clock (SCL)

This input is used to synchronize the data transfer to and from the device.

3.3 Oscillator Input/Output (X1, X2)

These pins are used as the connections for an external 32.768 kHz quartz crystal and load capacitors. X1 is the crystal oscillator input and X2 is the output. The MCP7940N is designed to allow for the use of external load capacitors in order to provide additional flexibility when choosing external crystals. The MCP7940N is optimized for crystals with a specified load capacitance of 6-9 pF.

X1 also serves as the external clock input when the MCP7940N is configured to use an external oscillator.

3.4 Multifunction Pin (MFP)

This is an output pin used for the alarm and square wave output functions. It can also serve as a general purpose output pin by controlling the OUT bit in the CONTROL register.

The MFP is an open-drain output and requires a pull-up resistor to Vcc (typically 10 kΩ). This pin may be left floating if not used.

3.5 Backup Supply (VBAT)

This is the input for a backup supply to maintain the RTCC and SRAM registers during the time when VCC is unavailable.

If the battery backup feature is not being used, the VBAT pin should be connected to VSS.

4.0 I²C BUS CHARACTERISTICS

4.1 I²C Interface

The MCP7940N supports a bidirectional 2-wire bus and data transmission protocol. A device that sends data onto the bus is defined as transmitter, and a device receiving data as receiver. The bus has to be controlled by a master device which generates the Start and Stop conditions, while the MCP7940N works as slave. Both master and slave can operate as transmitter or receiver but the master device determines which mode is activated.

4.1.1 BUS CHARACTERISTICS

The following **bus protocol** has been defined:

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is high. Changes in the data line while the clock line is high will be interpreted as a Start or Stop condition.

Accordingly, the following bus conditions have been defined (Figure 4-1).

4.1.1.1 Bus Not Busy (A)

Both data and clock lines remain high.

4.1.1.2 Start Data Transfer (B)

A high-to-low transition of the SDA line while the clock (SCL) is high determines a Start condition. All commands must be preceded by a Start condition.

4.1.1.3 Stop Data Transfer (C)

A low-to-high transition of the SDA line while the clock (SCL) is high determines a Stop condition. All operations must end with a Stop condition.

4.1.1.4 Data Valid (D)

The state of the data line represents valid data when, after a Start condition, the data line is stable for the duration of the high period of the clock signal.

The data on the line must be changed during the low period of the clock signal. There is one bit of data per clock pulse.

Each data transfer is initiated with a Start condition and terminated with a Stop condition. The number of the data bytes transferred between the Start and Stop conditions is determined by the master device.

4.1.1.5 Acknowledge

Each receiving device, when addressed, is obliged to generate an Acknowledge signal after the reception of each byte. The master device must generate an extra clock pulse which is associated with this Acknowledge bit.

Note:	The I²C interface is disabled while operating from the backup power supply.

A device that acknowledges must pull down the SDA line during the Acknowledge clock pulse in such a way that the SDA line is stable-low during the high period of the Acknowledge-related clock pulse. Of course, setup and hold times must be taken into account. During reads, a master must signal an end of data to the slave by NOT generating an Acknowledge bit on the last byte that has been clocked out of the slave. In this case, the slave (MCP7940N) will leave the data line high to enable the master to generate the Stop condition.

FIGURE 4-1: DATA TRANSFER SEQUENCE ON THE SERIAL BUS

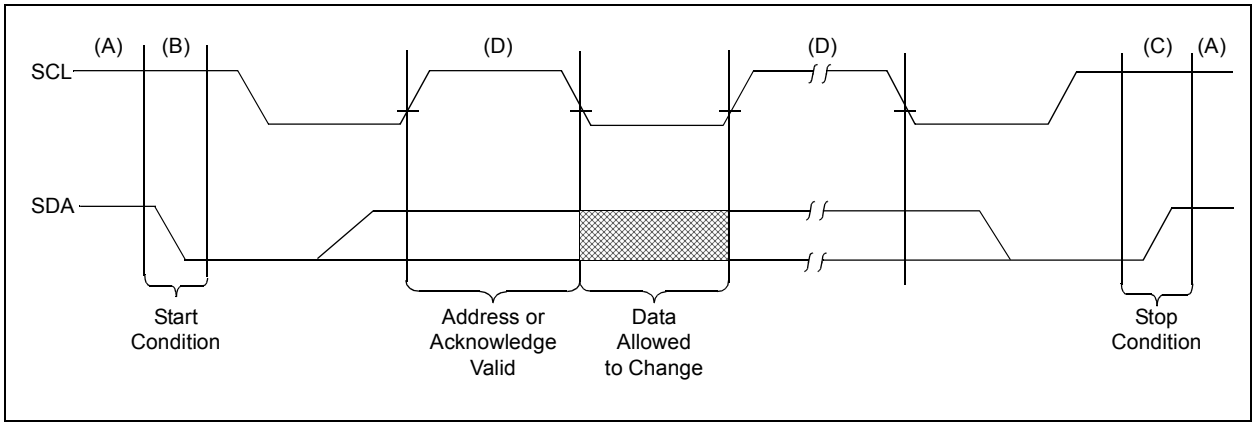


FIGURE 4-2: ACKNOWLEDGE TIMING

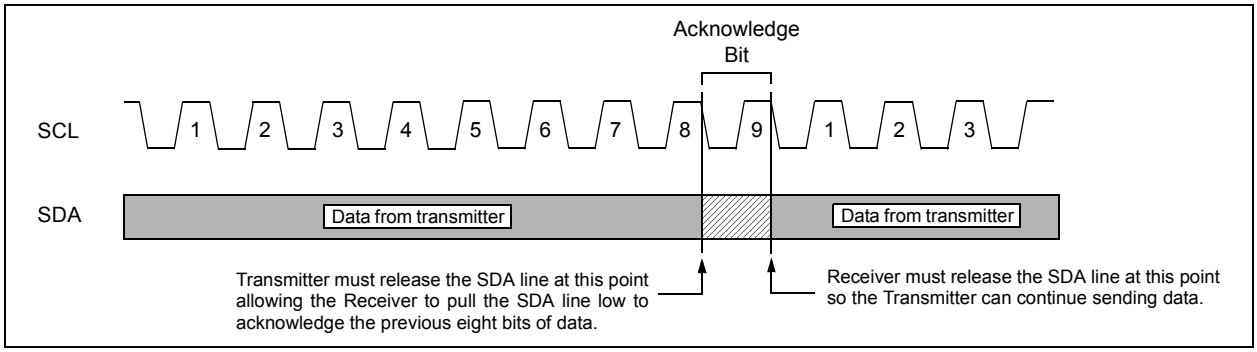


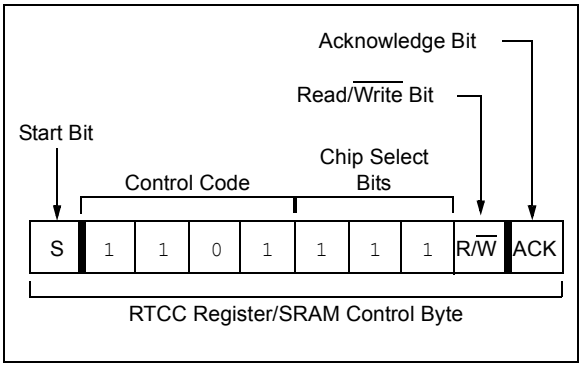
4.1.2 DEVICE ADDRESSING

The control byte is the first byte received following the Start condition from the master device (Figure 4-3). The control byte begins with a 4-bit control code. For the MCP7940N, this is set '1101' for register read and write operations. The next three bits are non-configurable Chip Select bits that must always be set to '1'.

The last bit of the control byte defines the operation to be performed. When set to a '1' a read operation is selected, and when set to a '0' a write operation is selected.

The combination of the 4-bit control code and the three Chip Select bits is called the slave address. Upon receiving a valid slave address, the slave device outputs an acknowledge signal on the SDA line. Depending on the state of the R/$\overline{W}$ bit, the MCP7940N will select a read or a write operation.

FIGURE 4-3: CONTROL BYTE FORMAT



5.0 FUNCTIONAL DESCRIPTION

The MCP7940N is a highly-integrated Real-Time Clock/Calendar (RTCC). Using an on-board, low-power oscillator, the current time is maintained in seconds, minutes, hours, day of week, date, month, and year. The MCP7940N also features 64 bytes of general purpose SRAM. Two alarm modules allow interrupts to be generated at specific times with flexible comparison options. Digital trimming can be used to compensate for inaccuracies inherent with crystals. Using the backup supply input and an integrated power switch, the MCP7940N will automatically switch to backup power when primary power is unavailable, allowing the current time and the SRAM contents to be maintained. The time-stamp module captures the time when primary power is lost and when it is restored.

The RTCC configuration and Status registers are used to access all of the modules featured on the MCP7940N.

5.1 Memory Organization

The MCP7940N features two different blocks of memory: the RTCC registers and general purpose SRAM (Figure 5-1). They share the same address space, accessed through the '1101111X' control byte. Unused locations are not accessible. The MCP7940N will not acknowledge if the address is out of range, as shown in the shaded region of the memory map in Figure 5-1.

The RTCC registers are contained in addresses 0x00-0x1F. Table 5-1 shows the detailed RTCC register map. There are 64 bytes of user-accessible SRAM, located in the address range 0x20-0x5F. The SRAM is a separate block from the RTCC registers. All RTCC registers and SRAM locations are maintained while operating from backup power.

3: The ALMPOL bit in the ALM1WKDAY register is read-only and reflects the value of the ALMPOL bit in the ALM0WKDAY register.

5.2 Oscillator Configuration

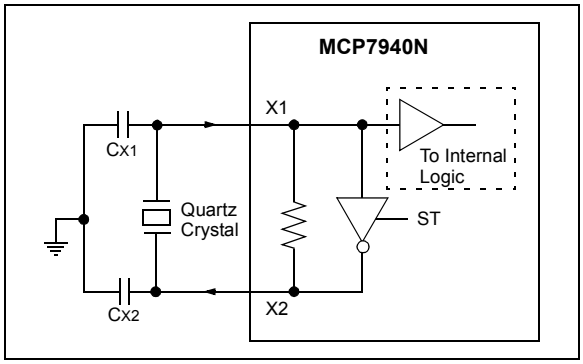
The MCP7940N can be operated in two different oscillator configurations: using an external crystal or using an external clock input.

5.2.1 EXTERNAL CRYSTAL

The crystal oscillator circuit on the MCP7940N is designed to operate with a standard 32.768 kHz tuning fork crystal and matching external load capacitors. By using external load capacitors, the MCP7940N allows for a wide selection of crystals. Suitable crystals have a load capacitance (C_L) of 6-9 pF. Crystals with a load capacitance of 12.5 pF are not recommended.

Figure 5-2 shows the pin connections when using an external crystal.

FIGURE 5-2: CRYSTAL OPERATION



Note 1:	The ST bit must be set to enable the crystal oscillator circuit.
2:	Always verify oscillator performance over the voltage and temperature range that is expected for the application.

5.2.1.1 Choosing Load Capacitors

C_L is the effective load capacitance as seen by the crystal, and includes the physical load capacitors, pin capacitance, and stray board capacitance. Equation 5-1 can be used to calculate C_L.

C_{X1} and C_{X2} are the external load capacitors. They must be chosen to match the selected crystal's specified load capacitance.

Note:	If the load capacitance is not correctly matched to the chosen crystal's specified value, the crystal may give a frequency outside of the crystal manufacturer's specifications.

EQUATION 5-1: LOAD CAPACITANCE CALCULATION

$$C_L = \frac{C_{X1} \times C_{X2}}{C_{X1} + C_{X2}} + C_{STRAY}$$

Where:

C_L = Effective load capacitance
C_{X1} = Capacitor value on X1 + C_{OSC}
C_{X2} = Capacitor value on X2 + C_{OSC}
C_{STRAY} = PCB stray capacitance

5.2.1.2 Layout Considerations

The oscillator circuit should be placed on the same side of the board as the device. Place the oscillator circuit close to the respective oscillator pins. The load capacitors should be placed next to the oscillator itself, on the same side of the board.

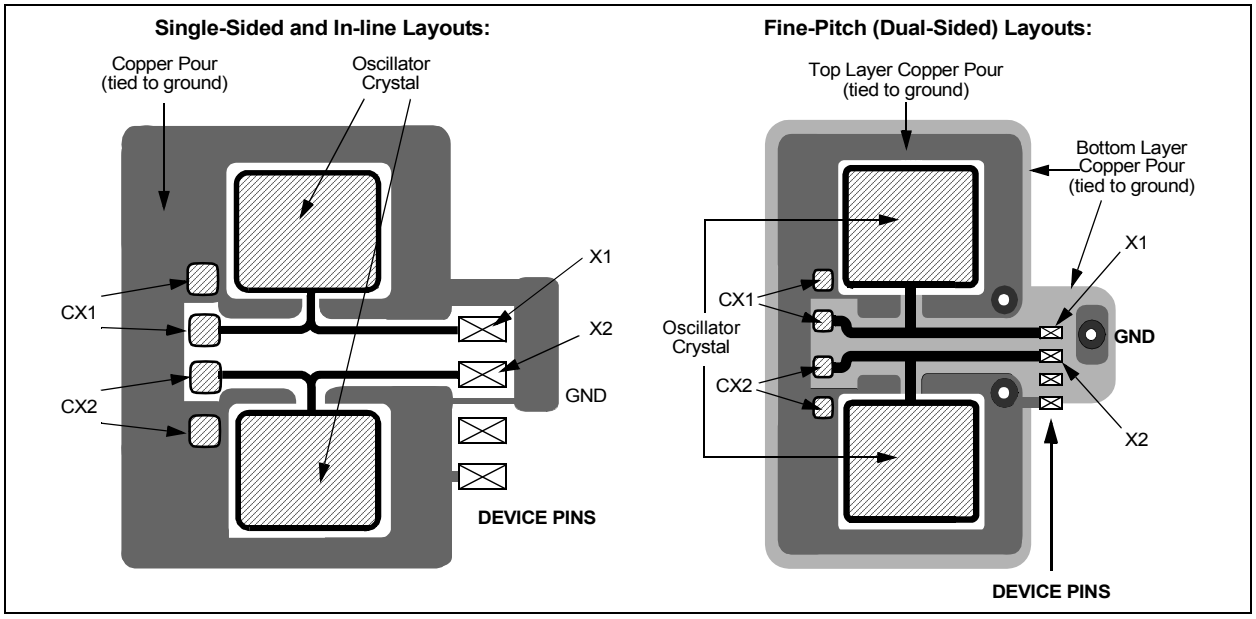
Use a grounded copper pour around the oscillator circuit to isolate it from surrounding circuits. The grounded copper pour should be routed directly to V_{SS}. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed.

Layout suggestions are shown in Figure 5-3. In-line packages may be handled with a single-sided layout that completely encompasses the oscillator pins. With fine-pitch packages, it is not always possible to completely surround the pins and components. A suitable solution is to tie the broken guard sections to a mirrored ground layer. In all cases, the guard trace(s) must be returned to ground.

For additional information and design guidance on oscillator circuits, please refer to these Microchip Application Notes, available at the corporate web site (www.microchip.com):

- *AN1365, "Recommended Usage of Microchip Serial RTCC Devices"*
- *AN1519, "Recommended Crystals for Microchip Stand-Alone Real-Time Clock Calendar Devices"*

FIGURE 5-3: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT

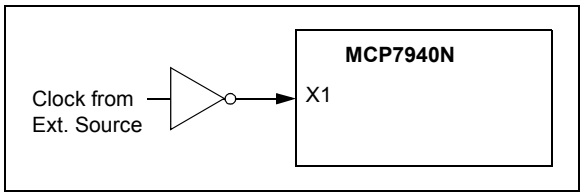


5.2.2 EXTERNAL CLOCK INPUT

A 32.768 kHz external clock source can be connected to the X1 pin (Figure 5-4). When using this configuration, the X2 pin should be left floating.

Note:	The EXTOSC bit must be set to enable an external clock source.

FIGURE 5-4: EXTERNAL CLOCK INPUT OPERATION



5.2.3 OSCILLATOR FAILURE STATUS

The MCP7940N features an oscillator failure flag, OSCRUN, that indicates whether or not the oscillator is running. The OSCRUN bit is automatically set after 32 oscillator cycles are detected. If no oscillator cycles are detected for more than TOSF, then the OSCRUN bit is automatically cleared (Figure 5-5). This can occur if the oscillator is stopped by clearing the ST bit or due to oscillator failure.

FIGURE 5-5: OSCILLATOR FAILURE STATUS TIMING DIAGRAM

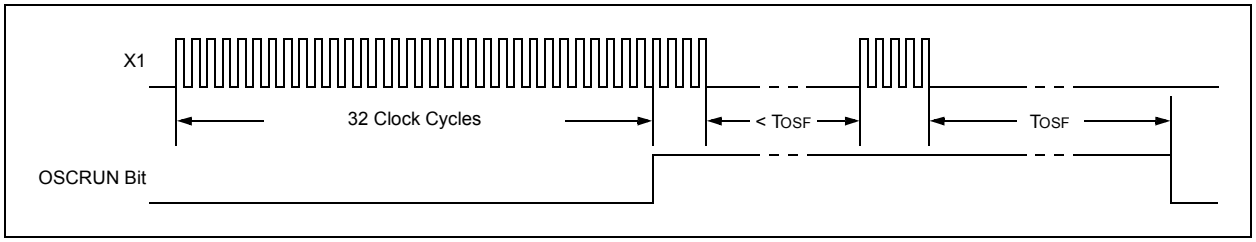


TABLE 5-2: SUMMARY OF REGISTERS ASSOCIATED WITH OSCILLATOR CONFIGURATION

Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Register on Page

Legend: — = unimplemented location, read as '0'. Shaded cells are not used by oscillator configuration.

5.3 Timekeeping

The MCP7940N maintains the current time and date using an external 32.768 kHz crystal or clock source. Separate registers are used for tracking seconds, minutes, hours, day of week, date, month, and year. The MCP7940N automatically adjusts for months with less than 31 days and compensates for leap years from 2001 to 2399. The year is stored as a two-digit value.

Both 12-hour and 24-hour time formats are supported and are selected using the 12/$\overline{24}$ bit.

The day of week value counts from 1 to 7, increments at midnight, and the representation is user-defined (i.e., the MCP7940N does not require 1 to equal Sunday, etc.).

All time and date values are stored in the registers as binary-coded decimal (BCD) values. The MCP7940N will continue to maintain the time and date while operating off the backup supply.

When reading from the timekeeping registers, the registers are buffered to prevent errors due to rollover of counters. The following events cause the buffers to be updated:

- When a read is initiated from the RTCC registers (addresses 0x00 to 0x1F)
- During an RTCC register read operation, when the register address rolls over from 0x1F to 0x00

The timekeeping registers should be read in a single operation to utilize the on-board buffers and avoid rollover issues.

Note 1: Loading invalid values into the time and date registers will result in undefined operation.

2: To avoid rollover issues when loading new time and date values, the oscillator/clock input should be disabled by clearing the ST bit for External Crystal mode and the EXTOSC bit for External Clock Input mode. After waiting for the OSCRUN bit to clear, the new values can be loaded and the ST or EXTOSC bit can then be re-enabled.

5.3.1 DIGIT CARRY RULES

The following list explains which timer values cause a digit carry when there is a rollover:

- Time of day: from 11:59:59 PM to 12:00:00 AM (12-hour mode) or 23:59:59 to 00:00:00 (24-hour mode), with a carry to the Date and Weekday fields
- Date: carries to the Month field according to Table 5-3
- Weekday: from 7 to 1 with no carry
- Month: from 12/31 to 01/01 with a carry to the Year field
- Year: from 99 to 00 with no carry

TABLE 5-3: DAY TO MONTH ROLLOVER SCHEDULE

Month	Name	Maximum Date
01	January	31
02	February	28 or 29(1)
03	March	31
04	April	30
05	May	31
06	June	30
07	July	31
08	August	31
09	September	30
10	October	31
11	November	30
12	December	31

Note 1: 29 during leap years, otherwise 28.

REGISTER 5-1: RTCSEC: TIMEKEEPING SECONDS VALUE REGISTER (ADDRESS 0x00)

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

If 12/$\overline{24}$ = 1 (12-hour format):

bit 7 **Unimplemented:** Read as '0'

bit 6 **12/$\overline{24}$:** 12 or 24 Hour Time Format bit
1 = 12-hour format
0 = 24-hour format

bit 5 **$\overline{AM}$/PM:** AM/PM Indicator bit
1 = PM
0 = AM

bit 4 **HRTEN0:** Binary-Coded Decimal Value of Hour's Tens Digit
Contains a value from 0 to 1

bit 3-0 **HRONE<3:0>:** Binary-Coded Decimal Value of Hour's Ones Digit
Contains a value from 0 to 9

If 12/$\overline{24}$ = 0 (24-hour format):

bit 7 **Unimplemented:** Read as '0'

bit 6 **12/$\overline{24}$:** 12 or 24 Hour Time Format bit
1 = 12-hour format
0 = 24-hour format

bit 5-4 **HRTEN<1:0>:** Binary-Coded Decimal Value of Hour's Tens Digit
Contains a value from 0 to 2.

bit 3-0 **HRONE<3:0>:** Binary-Coded Decimal Value of Hour's Ones Digit
Contains a value from 0 to 9

REGISTER 5-4: RTCWKDAY: TIMEKEEPING WEEKDAY VALUE REGISTER (ADDRESS 0x03)

U-0	U-0	R-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-1
—	—	OSCRUN	PWRFAIL	VBATEN	WKDAY2	WKDAY1	WKDAY0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is clear	x = Bit is unknown

bit 7-6 **Unimplemented:** Read as '0'

bit 5 **OSCRUN:** Oscillator Status bit
1 = Oscillator is enabled and running
0 = Oscillator has stopped or has been disabled

bit 4 **PWRFAIL:** Power Failure Status bit(1,2)
1 = Primary power was lost and the power-fail time-stamp registers have been loaded (must be cleared in software). Clearing this bit resets the power-fail time-stamp registers to '0'.
0 = Primary power has not been lost

bit 3 **VBATEN:** External Battery Backup Supply (V_{BAT}) Enable bit
1 = V_{BAT} input is enabled
0 = V_{BAT} input is disabled

bit 2-0 **WKDAY<2:0>:** Binary-Coded Decimal Value of Day of Week
Contains a value from 1 to 7. The representation is user-defined.

Note 1: The PWRFAIL bit must be cleared to log new time-stamp data. This is to ensure previous time-stamp data is not lost.

2: The PWRFAIL bit cannot be written to a '1' in software. Writing to the RTCWKDAY register will always clear the PWRFAIL bit.

Legend: — = unimplemented location, read as '0'. Shaded cells are not used in timekeeping.

5.4 Alarms

The MCP7940N features two independent alarms. Each alarm can be used to either generate an interrupt at a specific time in the future, or to generate a periodic interrupt every minute, hour, day, day of week, or month.

There is a separate interrupt flag, ALMxIF, for each alarm. The interrupt flags are set by hardware when the chosen alarm mask condition matches (Table 5-5). The interrupt flags must be cleared in software.

If either alarm module is enabled by setting the corresponding ALMxEN bit in the CONTROL register, and if the square wave clock output is disabled (SQWEN = 0), then the MFP will operate in Alarm Interrupt Output mode. Refer to **Section 5.5 "Output Configurations"** for details. The alarm interrupt output is available while operating from the backup power supply.

Both Alarm0 and Alarm1 offer identical operation. All time and date values are stored in the registers as binary-coded decimal (BCD) values.

Note: Throughout this section, references to the register and bit names for the alarm modules are referred to generically by the use of 'x' in place of the specific module number. Thus, "ALMxSEC" might refer to the seconds register for Alarm0 or Alarm1.

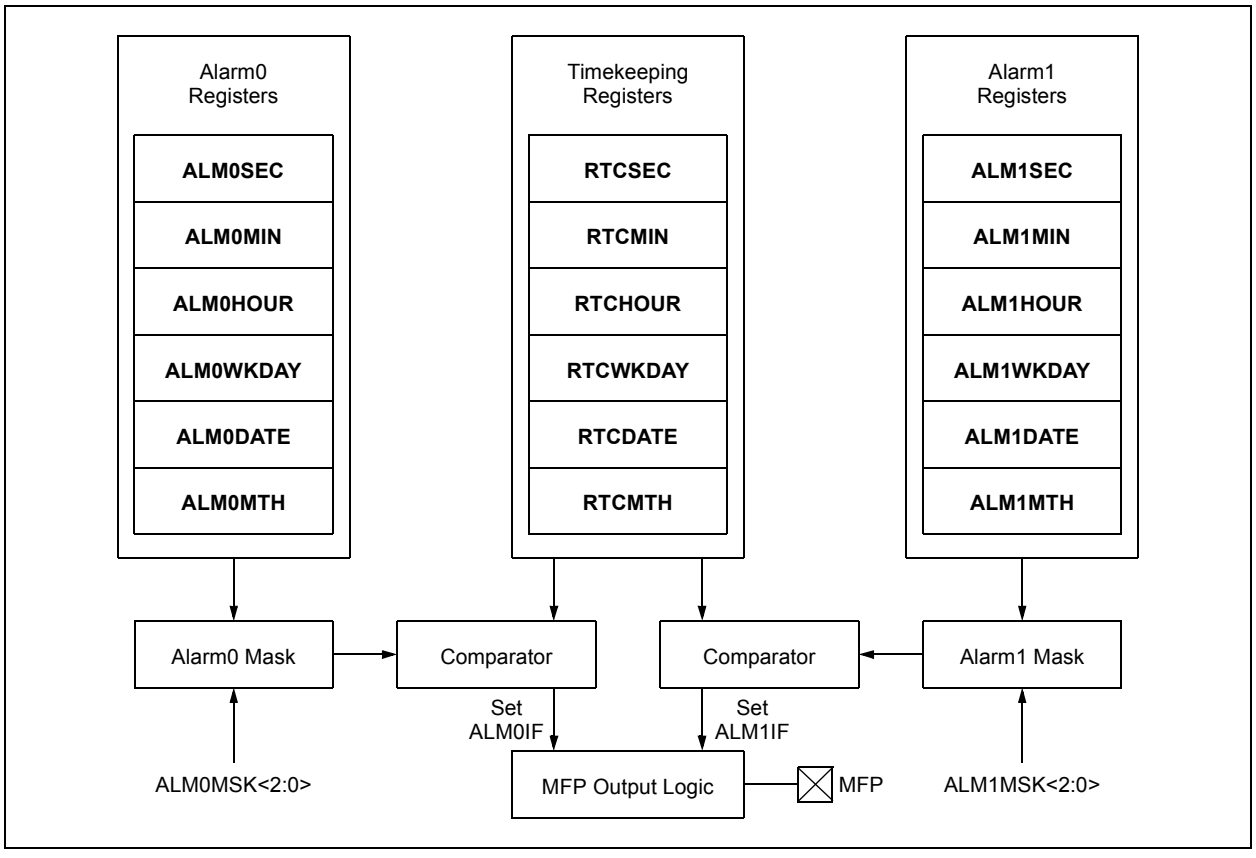
TABLE 5-5: ALARM MASKS

ALMxMSK<2:0>	Alarm Asserts on Match of
000	Seconds
001	Minutes
010	Hours
011	Day of Week
100	Date
101	Reserved
110	Reserved
111	Seconds, Minutes, Hours, Day of Week, Date, and Month

Note 1: The alarm interrupt flags must be cleared by the user. If a flag is cleared while the corresponding alarm condition still matches, the flag will be set again, generating another interrupt.

2: Loading invalid values into the alarm registers will result in undefined operation.

FIGURE 5-6: ALARM BLOCK DIAGRAM



5.4.1 CONFIGURING THE ALARM

In order to configure the alarm modules, the following steps need to be performed:

1. Load the timekeeping registers and enable the oscillator
2. Configure the ALMxMSK<2:0> bits to select the desired alarm mask
3. Set or clear the ALMPOL bit according to the desired output polarity
4. Ensure the ALMxIF flag is cleared
5. Based on the selected alarm mask, load the alarm match value into the appropriate register(s)
6. Enable the alarm module by setting the ALMxEN bit

-n = Value at POR	'1' = Bit is set	'0' = Bit is clear	x = Bit is unknown

If 12/$\overline{24}$ = 1 (12-hour format):

bit 7 **Unimplemented:** Read as '0'

bit 6 **12/$\overline{24}$:** 12 or 24 Hour Time Format bit(1)
1 = 12-hour format
0 = 24-hour format

bit 5 **$\overline{AM}$/PM:** AM/PM Indicator bit
1 = PM
0 = AM

bit 4 **HRTEN0:** Binary-Coded Decimal Value of Hour's Tens Digit
Contains a value from 0 to 1

bit 3-0 **HRONE<3:0>:** Binary-Coded Decimal Value of Hour's Ones Digit
Contains a value from 0 to 9

If 12/$\overline{24}$ = 0 (24-hour format):

bit 7 **Unimplemented:** Read as '0'

bit 6 **12/$\overline{24}$:** 12 or 24 Hour Time Format bit(1)
1 = 12-hour format
0 = 24-hour format

bit 5-4 **HRTEN<1:0>:** Binary-Coded Decimal Value of Hour's Tens Digit
Contains a value from 0 to 2.

bit 3-0 **HRONE<3:0>:** Binary-Coded Decimal Value of Hour's Ones Digit
Contains a value from 0 to 9

Note 1: This bit is read-only and reflects the value of the 12/$\overline{24}$ bit in the RTCHOUR register.

REGISTER 5-11: ALMxWKDAY: ALARM0/1 WEEKDAY VALUE REGISTER (ADDRESSES 0x0D/ 0x14)

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-1

bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is clear	x = Bit is unknown

bit 7 **ALMPOL:** Alarm Interrupt Output Polarity bit
1 = Asserted output state of MFP is a logic high level
0 = Asserted output state of MFP is a logic low level

bit 6-4 **ALMxMSK<2:0>:** Alarm Mask bits
000 = Seconds match
001 = Minutes match
010 = Hours match (logic takes into account 12-/24-hour operation)
011 = Day of week match
100 = Date match
101 = Reserved; do not use
110 = Reserved; do not use
111 = Seconds, Minutes, Hour, Day of Week, Date and Month

bit 3 **ALMxIF:** Alarm Interrupt Flag bit(1,2)
1 = Alarm match occurred (must be cleared in software)
0 = Alarm match did not occur

bit 2-0 **WKDAY<2:0>:** Binary-Coded Decimal Value of Day bits
Contains a value from 1 to 7. The representation is user-defined.

Note 1: If a match condition still exists when this bit is cleared, it will be set again automatically.
2: The ALMxIF bit cannot be written to a 1 in software. Writing to the ALMxWKDAY register will always clear the ALMxIF bit.

5.5 Output Configurations

The MCP7940N features Square Wave Clock Output, Alarm Interrupt Output, and General Purpose Output modes. All of the output functions are multiplexed onto MFP according to Table 5-7.

Only the alarm interrupt outputs are available while operating from the backup power supply. If none of the output functions are being used, the MFP can safely be left floating.

Note:	The MFP is an open-drain output and requires a pull-up resistor to VCC (typically 10 kΩ).

TABLE 5-7: MFP OUTPUT MODES

SQWEN	ALM0EN	ALM1EN	Mode
0	0	0	General Purpose Output
0	1	0	Alarm Interrupt Output
0	0	1	
0	1	1	
1	x	x	Square Wave Clock Output
