

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

General Description

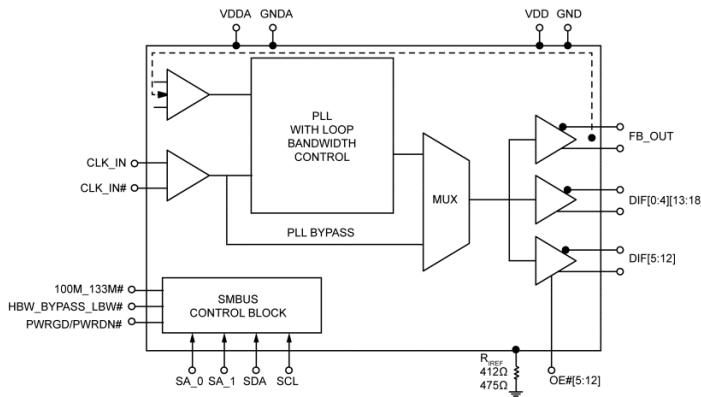

The MDB1900ZC is a true zero delay buffer with a fully integrated, high-performance, low-power, and low-phase noise programmable PLL.

The MDB1900ZC is capable of distributing the reference clocks for PCIe (Gen1/Gen2/Gen3), SATA, ESI, SAS, SMI, and Intel® Quickpath Interconnect (QPI). The MDB1900ZC works in conjunction with a CK410B+, CK509B, or CK420BQ clock synthesizer to provide reference clocks to multiple agents.

The MDB1900ZC is designed for Intel's DB1900Z specification with the exception that the zero delay buffer feedback path is inside the IC and does not need to be built onto the PCB.

Datasheets and support documentation are available on Micrel's website at: www.micrel.com.

Block Diagram

Features

- Supports zero delay (0ps) buffer mode for 100MHz and 133MHz clock frequencies.
- Internal feedback path for zero delay (PLL) mode
- Zero delay (PLL) mode can filter jitter in incoming clock
- Selectable PLL bandwidth for PLL mode
- Supports fanout buffer mode for clock frequencies between 0MHz and 250MHz
- Differential input reference with HCSL logic (0V~0.7V)
- Nineteen differential HCSL-compatible clock output pairs
- Eight dedicated OE# pins to control their assigned output. Glitch free assertion/de-assertion.
- Spread spectrum modulation tolerant for EMI reduction
- SMBus interface for controlling output properties (enable/disable and delay tuning)
- Disabled outputs in power-down mode for maximum power savings
- Nine selectable SMBus addresses so multiple devices can share the same SMBus
- 3.3V or 2.5V operation
- Commercial or industrial temperature ranges
- 72-pin 10mm × 10mm QFN package
- GREEN, RoHS, and PFOS compliant

Applications

- PCI Express timing (Gen1/2/3) in Intel platforms, specifically the Romley platform
- SATA/SAS timing (storage)
- ESI and SMI systems (storage)
- Intel Quickpath Interconnect

Key Specifications

- Cycle-to-cycle jitter (PLL mode): <35ps
- Output-to-output skew: <35ps
- Input-to-output delay (PLL mode): Fixed at 0ps
- Input-to-output delay variation (PLL mode): 13ps
- Phase jitter, PCIe Gen3: 0.25ps
- Accumulated jitter, QPI 9.6Gbps: <0.15ps

Notes:

11. This is the time from ramping the power supply, or assertion the PWRGD and when valid CLK_IN input until the time that stable clocks are output from the device (PLL locked).
12. All long-time accuracy and clock period specifications are guaranteed assuming that the input reference (CLK_IN, CLK_IN#) meets the CK410B+ or CK420BQ clock period specifications.
13. The long accuracy is 0ppm, when average only over any integer number of SSC periods.
14. When (SSC_{OFF}), using the frequency counter with the measurement interval equal to or greater than 0.15s, target frequencies are 100,000,000Hz, 133,333,333Hz.
15. When (SSC_{ON}), using the frequency counter with the measurement interval equal to or greater than 0.15s, target frequencies are 99,750,000Hz, 133,000,000Hz.
16. Measurement taken from differential waveform.
17. The average period over any 1 μs period of time must be greater than the minimum and less than the maximum specified period.
18. Measure taken from differential waveform on a component test board. The edge (slew) rate is measured from (-150mV) to (+150mV) on the differential waveform. Scope is set to average. Signal must be monotonic through the V_{OL} to V_{OH} region for T_R and T_F .
19. Measured from $V_{OL} = 0.175V$ and $V_{OH} = 0.525V$. Only valid for rising clock and falling CLK#. Signal must be monotonic through V_{OL} to V_{OH} region for T_R and T_F . Measurement taken from single-ended waveform. The translation will be (0.5V/ns minimum to 2V/ns maximum) for single-ended edge rate. Refer to Figure 2.

| Total ΔV_{ox} | Total Variation of V_{ox} Over All Edges ^(20, 26) | Statistical measurement on single-ended signal using absolute value. | | | 140 | mV |

Notes:

21. Measured with oscilloscope, averaging off, and using minimum/maximum statistics. Variation is the delta between minimum and maximum.
22. Measured with oscilloscope, averaging on, the difference between the rising edge rate (average) of clock versus the falling edge rate (average) of clock#.
23. A statistical average high value for V_{HIGH} obtained by using the oscilloscope V_{HIGH} math function.
24. A statistical average low value for V_{LOW} obtained by using the V_{LOW} math function.
25. The crossing point should meet the absolute and relative crossing point specifications simultaneously.
26. ΔV_{ox} is defined as the total variation of all crossing voltages of rising CLOCK and falling CLOCK#.

Notes:

27. Measured from differential crossing point (V_{Ox}) to differential crossing point (V_{Ox}) with scope averaging on to find mean value. V_{Ox} (relative) minimum and maximum are derived using the following: V_{Ox} (relative) minimum = $0.250 + 0.5 V_{HAGV} - 0.7V$ and V_{Ox} (relative) maximum = $0.550 - 0.5 (0.7V - V_{HAGV})$.
28. Measured into fixed 2pF load capacitor. Input to output skew is measured at the first output edge following the corresponding input.
29. This parameter is measured at the outputs of two MDB1900ZC devices in the HBW mode driven by a CK420BQ. The random differential tracking error is the differential phase jitter. It is the accumulated phase jitter, not including the effect of spread spectrum and not shared by the outputs. The jitter is measured into 2pF load cap and from differential cross-point to differential cross-point
30. This is the P2P difference in spread spectrum tracking error between two MDB1900ZC devices in Hi BW mode. The parameter is measured at the output of two MDB1900ZC devices driven by a CK420BQ with SSCON.
31. Duty Cycle Distortion is the difference in duty cycle between the output and the input clock when the device is operated in bypass mode.

Notes:

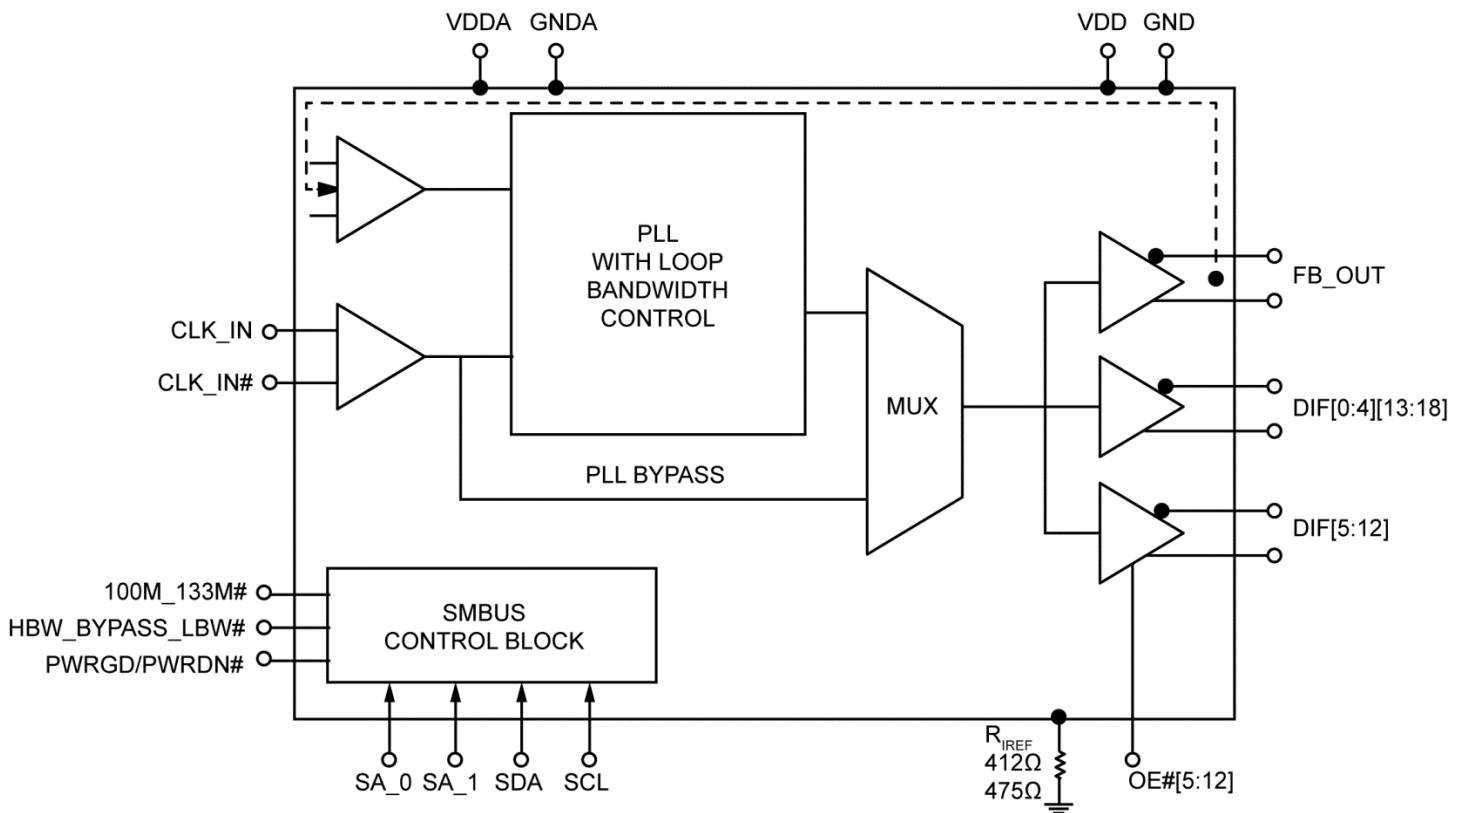

32. Measured as maximum pass band gain. At frequencies with the loop BW, highest point-of-magnification is called PLL jitter peaking.
33. Measured at 3dB down or half-power point.
34. These jitter numbers are defined for a BER of 1E-12. Measured numbers at a smaller sample size have to be extrapolated to this BER target.
35. PCIe Gen3 filter characteristics are subject to final ratification by PCI-SIG. Check with PCI-SIG for latest specification.
36. The damping factor = 0.54 implies a jitter peaking of 3dB.

Feedback (FB_OUT, FB_OUT#) Topology

The MDB1900ZC utilizes external feedback topology to achieve low input-to-output delay variation. Place the shunt and series resistors as close to the (FB_OUT, FB_OUT#) (Pins 18 and 17) as possible (refer to [Figure 1](#)).

Termination of HCSL [DIF, DIF# (18:0)] Output Buffers for Testing Conditions

All differential output parameters are measured while driving 10-inch 100Ω or 85Ω differential impedance transmission line segments with 2pF load capacitors at the end of each segment. Measurements are taken across the 2pF load capacitor associated with Clock and Clock# as shown in [Figure 5](#) and [Figure 6](#). For resistive lumped load, board trace impedance and trace length refer to [Table 3](#).

Functional Description

CLK_IN, CLK_IN# Input Reference

The reference clock (CLK_IN, CLK_IN#) is an HCSL (0.7V) differential input with 100MHz or 133.33MHz frequency from CK410B+, CK509B, or CK420BQ clock Synthesizer. The input (CLK_IN, CLK_IN#) has the option to have spread spectrum ON or spread spectrum OFF. The spread spectrum clocking (SSC) has modulation frequency value of 30kHz to 33kHz, with modulation of -0.5% down-spread (maximum). The modulation profile is Triangular or Lexmark.

OE# and Output Enables (Control Registers)

OE# pins are dedicated control pins for DIF [12:5] outputs and are asynchronous asserted-low signals. Each output can be individually enabled or disabled by SMBus control register bits. The output enable bits in the SMBus registers are active high and by default are set to enable.

OE# Assertion (Transition from Logic 1 to Logic 0)

All differential outputs that were tri-stated are to resume normal operation in a glitch free manner. The latency from the assertion to active outputs is 4 – 12 DIF clock periods.

OE# De-Assertion (Transition from Logic 0 to Logic 1)

The impact of de-asserting OE# is each corresponding differential output will transition from normal operation to tri-state in a glitch free manner. A minimum of four valid clocks will be provided after OE# de-assertion. The maximum latency from the de-assertion to tri-stated outputs is twelve DIF clock periods.

Table 4. OE Functionality

| Inputs | | OE# Hardware Pins and Control Register Bits | | | | | Outputs | PLL State |
|------------------|--------------------|---|------|---------------------|-----------------------------|--------------------|---------|-----------|
| PWRGD/ PWRGD# | CLK_IN/ CLK_IN# | SMBus Enable Bit | OE # | DIF/DIF#_ [12:5] | DIF/DIF#_ [18:13], [4:0] | FB_OUT/ FB_OUT# | | |

| | | 1 | 0 | Running | Running | Running | ON | |
| | | 1 | 1 | Hi-Z | Running | Running | ON | |

100M_133M# (Frequency Selection)

The 100M_133M# is a hardware pin which programs the appropriate output frequency. The MDB1900ZC is operated in the 1:1 mode only; therefore the CLK_IN frequency is equal to DIF [18:0] frequency. The frequency selection can be enabled by 100M_133M# pin or by SMBus control register bit.

Note: The default frequency at power-up is 100MHz.

Table 5. Frequency Program

| 100M_133M# | Optimized Frequency (CLK_IN = DIF_[18:0]) |
|------------|--|
| 0 | 133.33MHz |
| 1 | 100.00MHz (Default) |

PWRGD/PWRDN#

De-assertion of PWRGD (Logic 0) which becomes PWRDN# indicates a power-down mode, which will shut off all clocks cleanly. PWRDN# is asynchronous active low input, and instructs the device to enter power saving mode. PWRDN# should be asserted low prior to shutting off the input clock or power to ensure all clocks shut down in a glitch-free manner, and all outputs will be tri-stated.

Table 6. PWRGD/PWRGDN# Functionality

| PWRGD/ PWRGDN# | DIF_/DIF# [18:0] | Notes |
|-------------------|---------------------|-----------------|
| 0 | Tri-State | Power-Down Mode |
| 1 | Normal | Active Mode |

PWRGD Assertion

The power-up latency is less than 1.8ms. This is the time from the assertion of the PWRGD pin or the ramping of the power supply and the time from valid CLK_IN input clock until the time that stable clocks are output from the buffer chip (PLL locked).

The assertion and de-assertion of PWRDN# is absolutely asynchronous

Note: It is not recommended to disable (CLK_IN, CLK_IN#) input prior to assertion of PWRDN# and operation in this mode can result in glitches and excessive frequency shifting.

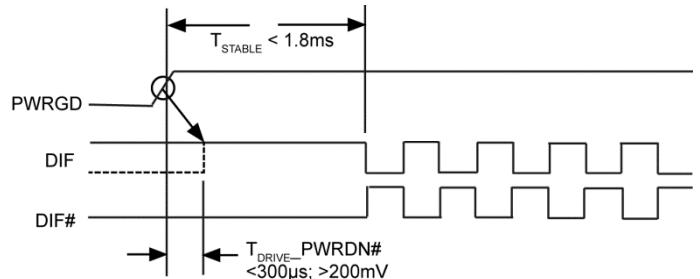

Figure 7. PWRGD Assertion (Power-Down De-Assertion)

PWRDN# Assertion

When PWRDN# is sampled as being asserted by two consecutive rising edges of DIF#, all differential outputs must be tri-stated on the next DIF# high-to-low transition.

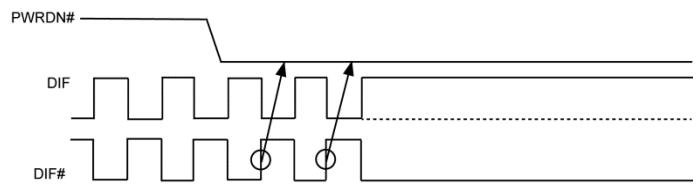

Figure 8. PWRDN# Assertion

HBW_BYPASS_LBW#

The HBW_BYPASS_LBW# is a tri-level function input pin. It is used to select between PLL high-bandwidth, bypass mode and PLL low bandwidth. The PLL HBW, BYPASS and PLL LBW mode may be selected via writing to SMBus register or by asserting the HBW_BYPASS_LBW input pin to the appropriate level per Table 7.

Table 7. PLL Bandwidth and Readback

| M (Mid) | BYPASS (Bypass PLL) | 0 | 1 |
| H (High) | HBW (High PLL Bandwidth) | 1 | 1 |

SA_0, SA_1 (Address Selection)

SA_0 and SA_1 are tri-level hardware pins that can configure the MDB1900ZC to nine different addresses.

MDB1900ZC Control Registers

SDA, SCL (Pins 12, 13)

The serial data (SDA) and serial clock (SCL) are dedicated for SMBus application and designed for 400Kb/s (maximum).

The SDA and SCL pins do not have internal pull-up resistors. When the device is in power-down mode, the SDA and SCL inputs are tri-stated and all programming information is retained.

All electrical characteristics meet the standard mode specifications of the SMBus 2.0 specification. For SDA and SCL input specs, refer to the [DC Electrical Characteristics^{\(6\)}](#).
