

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

General Description

The MIC2289C is a PWM (pulse width modulated), boost-switching regulator that is optimized for constant-current white LED driver applications. The MIC2289C features an internal Schottky diode and three levels of output overvoltage protection providing a small size and efficient DC/DC solution that requires only four external components.

To optimize efficiency, the feedback voltage is set to only 95mV. This reduces power dissipation in the current set resistor and allows the lowest total output voltage, hence minimal current draw from the battery.

The MIC2289C implements a constant frequency 1.2MHz PWM control scheme. The high frequency, PWM operation saves board space by reducing external component sizes. The added benefit of the constant frequency PWM scheme in comparison to variable frequency is much lower noise and input ripple injected to the input power source.

The MIC2289C clamps the output voltage in case of open LED conditions, protecting itself and the output capacitor. The MIC2289C is available with an output OVP option of 34V.

The MIC2289C is available in low profile 6-pin Thin SOT-23 package. The MIC2289C has a junction temperature range of -40°C to $+125^{\circ}\text{C}$.

Data sheets and support documentation can be found on Micrel's web site at: www.micrel.com.

Features

- 2.5V to 10V input voltage
- Output voltage up to 34V with OVP
- Internal Schottky diode
- 1.2 MHz PWM operation
- Over 500mA switch current
- 95mV feedback voltage
- <1% line and load regulation
- <1 μA shutdown current
- Overtemperature protection
- UVLO
- Thin SOT-23 6-pin package
- -40°C to $+125^{\circ}\text{C}$ junction temperature range
- For higher performance specifications see the MIC2289

Applications

- White LED driver for backlighting:
 - Cell phones
 - PDAs
 - GPS systems
 - Digital cameras
 - MP3 players
 - IP phones
- LED flashlights
- Constant current power supplies

Typical Application

7-Series White LED Driver

Ordering Information

Part Number	Marking Code	Overvoltage Protection	Junction Temp. Range	Package	Lead Finish
MIC2289C-34BD6	SM34	34V	-40°C to +125°C	6-Pin Thin SOT-23	Standard
MIC2289C-34YD6	SM34	34V	-40°C to +125°C	6-Pin Thin SOT-23	Pb-Free

Note: Marking bars may not be to scale.

Pin Configuration

6- Pin Thin SOT-23 (D6)

Pin Description

Pin Number	Pin Name	Pin Name
1	SW	Switch node (Input): Internal power BIPOLAR collector.
2	GND	Ground (Return): Ground.
3	FB	Feedback (Input): Output voltage sense node. Connect the cathode of the LED to this pin. A resistor from this pin to ground sets the LED current.
4	EN	Enable (Input): Logic high enables regulator. Logic low shuts down regulator.
5	VIN	Supply (Input): 2.7V to 8V for internal circuitry.
6	OUT	Output Pin and Overvoltage Protection (Output): Connect to the output capacitor and LEDs.

Absolute Maximum Ratings⁽¹⁾

Supply Voltage (V_{IN})	12V
Switch Voltage (V_{SW})	-0.3V to 34V
Enable Pin Voltage (V_{EN})	-0.3V to V_{IN}
FB Voltage (V_{FB})	6V
Switch Current (I_{SW})	2A
Ambient Storage Temperature (T_s)	-65°C to +150°C
Schottky Reverse Voltage (V_{DA})	34V
EDS Rating ⁽³⁾	2kV

Operating Ratings⁽²⁾

Supply voltage (V_{IN})	2.5V to +10V
Output Voltage (V_{OUT})	V_{IN} to V_{OVP}
Junction Temperature (T_J)	-40°C to +125°C
Package Thermal Resistance	
Thin SOT-23-6 (θ_{JA})	177°C/W

Electrical Characteristics⁽⁴⁾

$T_A = 25^\circ\text{C}$, $V_{IN} = V_{EN} = 3.6\text{V}$, $V_{OUT} = 10\text{V}$, $I_{OUT} = 20\text{mA}$, unless otherwise noted. **Bold** values indicate $-40^\circ\text{C} \leq T_J \leq +125^\circ\text{C}$.

Symbol	Parameter	Condition	Min	Typ	Max	Units
V_{IN}	Supply Voltage Range		2.5		10	V
V_{UVLO}	Under Voltage Lockout		1.8	2.1	2.4	V
I_{VIN}	Quiescent Current	$V_{FB} > 200\text{mV}$, (not switching)		2.5	5	mA
I_{SD}	Shutdown Current	$V_{EN} = 0\text{V}^{(5)}$		0.1	1	μA
V_{FB}	Feedback Voltage	($\pm 10\%$)	85	95	105	mV
I_{FB}	Feedback Input Current	$V_{FB} = 95\text{mV}$		-450		nA
	Line Regulation ⁽⁶⁾	$3\text{V} \leq V_{IN} \leq 5\text{V}$		0.5		%
	Load Regulation ⁽⁶⁾	$5\text{mA} \leq I_{OUT} \leq 20\text{mA}$		0.5		%
D_{MAX}	Maximum Duty Cycle		85	90		%
I_{SW}	Switch Current Limit			750		mA
V_{SW}	Switch Saturation Voltage	$I_{SW} = 0.5\text{A}$		450		mV
I_{SW}	Switch Leakage Current	$V_{EN} = 0\text{V}$, $V_{SW} = 10\text{V}$		0.01	5	μA
V_{EN}	Enable Threshold	TURN ON TURN OFF	1.5		0.4	V V
I_{EN}	Enable Pin Current	$V_{EN} = 10\text{V}$		20	40	μA
f_{SW}	Oscillator Frequency		1.05	1.2	1.35	MHz
V_D	Schottky Forward Drop	$I_D = 150\text{mA}$		0.8	1	V
I_{RD}	Schottky Leakage Current	$V_R = 30\text{V}$			4	μA
V_{OVP}	Overshoot Protection	MIC2289C-34YD6 only	27	32	37	V
T_J	Overtemperature Threshold Shutdown	Hysteresis		150 10		$^\circ\text{C}$ $^\circ\text{C}$

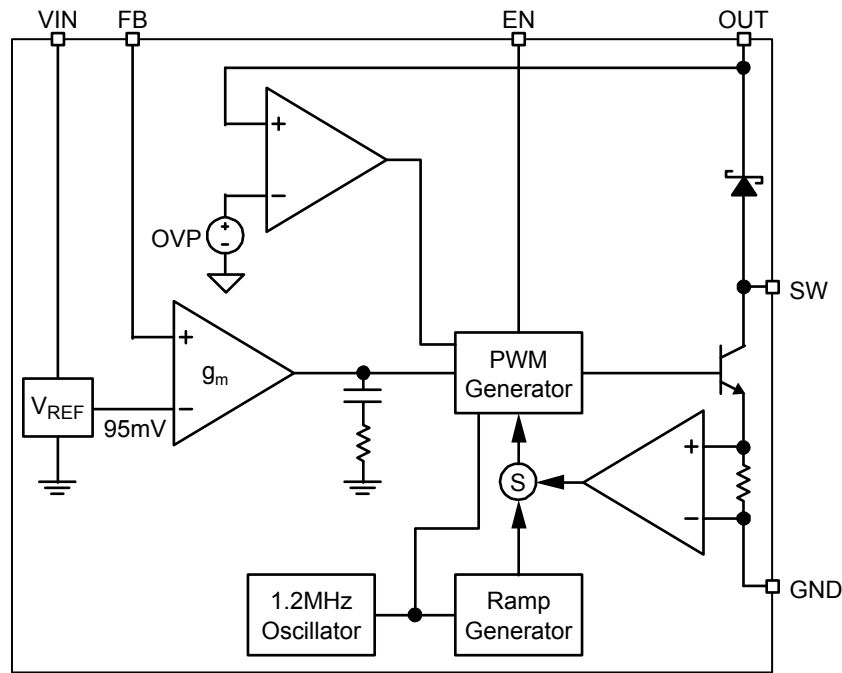

Notes:

- Absolute maximum ratings indicate limits beyond which damage to the component may occur. Electrical specifications do not apply when operating the device outside of its operating ratings. The maximum allowable power dissipation is a function of the maximum junction temperature, $T_{J(max)}$, the junction-to-ambient thermal resistance, θ_{JA} , and the ambient temperature, T_A . The maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown.
- The device is not guaranteed to function outside its operating rating.
- Devices are ESD sensitive. Handling precautions recommended. Human body model.
- Specification for packaged product only.
- $I_{SD} = I_{VIN}$.
- Guaranteed by design

Typical Characteristics

Functional Diagram

MIC2289C Block Diagram

Functional Description

The MIC2289C is a constant frequency, PWM current mode boost regulator. The block diagram is shown above. The MIC2289C is composed of an oscillator, slope compensation ramp generator, current amplifier, gm error amplifier, PWM generator, 500mA bipolar output transistor, and Schottky rectifier diode. The oscillator generates a 1.2MHz clock. The clock's two functions are to trigger the PWM generator that turns on the output transistor and to reset the slope compensation ramp generator. The current amplifier is used to measure the switch current by amplifying the voltage signal from the internal sense resistor. The output of the current amplifier is summed with the output of the slope compensation ramp generator. This summed current-loop signal is fed to one of the inputs of the PWM generator.

The gm error amplifier measures the LED current through the external sense resistor and amplifies the error between the detected signal and the 95mV reference voltage. The output of the gm error amplifier provides the voltage-loop signal that is fed to the other input of the PWM generator. When the current-loop signal exceeds the voltage-loop signal, the PWM generator turns off the bipolar output transistor. The next clock period initiates the next switching cycle, maintaining the constant frequency current-mode PWM control. The LED is set by the feedback resistor:

$$I_{LED} = \frac{95mV}{R_{FB}}$$

The Enable pin shuts down the output switching and disables control circuitry to reduce input current-to-leakage levels. Enable pin input current is zero at zero volts.

External Component Selection

inductor and output capacitor values for various series-LED applications.

The MIC2289C can be used across a wide range of applications. The table below shows recommended

Series LEDs	L	Manufacturer	Min C _{OUT}	Manufacturer

Dimming Control

There are two techniques for dimming control. One is PWM dimming, and the other is continuous dimming.

1. PWM dimming control is implemented by applying a PWM signal on EN pin as shown in Figure 1. The MIC2289C is turned on and off by the PWM signal. With this method, the LEDs operate with either zero or full current. The average LED current is increased proportionally to the duty-cycle of the PWM signal. This technique has high-efficiency because the IC and the LEDs consume no current during the off cycle of the PWM signal. Typical frequency should be between 100Hz and 10kHz.
2. Continuous dimming control is implemented by applying a DC control voltage to the FB pin of the MIC2289C through a series resistor as shown in Figure 2. The LED current is decreased proportionally with the amplitude of the control voltage. The LED intensity (current) can be dynamically varied applying a DC voltage to the FB pin. The DC voltage can come from a DAC signal, or a filtered PWM signal. The advantage of this approach is that a high frequency PWM signal (>10kHz) can be used to control LED intensity.

Figure 1. PWM Dimming Method

Figure 2. Continuous Dimming

Open-Circuit Protection

If the LEDs are disconnected from the circuit, or in case an LED fails open, the sense resistor will pull the FB pin to ground. This will cause the MIC2289C to switch with a high duty-cycle, resulting in output overvoltage. This would normally cause the SW pin voltage to exceed its maximum voltage rating, possibly damaging the IC and the external components. However, the MIC2289C has a dedicated OVP monitor to limit the output voltage within safe levels (see Figure 3).

Figure 3. Thin SOT-23 Package OVP Circuit

Start-Up and Inrush Current

During start-up, inrush current of approximately double the nominal current flows to set up the inductor current and the voltage on the output capacitor. If the inrush current needs to be limited, a soft-start circuit similar to Figure 4 could be implemented. The soft-start capacitor, C_{SS} , provides over-drive to the FB pin at start-up, resulting in gradual increase of switch duty cycle and limited inrush current.

Package Information

NOTE:

1. Dimensions and tolerances are as per ANSI Y14.5M, 1994.
2. Die is facing up for mold. Die is facing down for trim/form, ie. reverse trim/form.
3. Dimensions are exclusive of mold flash and gate burr.
4. The footlength measuring is based on the gauge plane method.
5. All specification comply to Jedec Spec MO193 Issue C.
6. All dimensions are in millimeters.
