

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Universal Serial Bus Transceiver

General Description

The MIC2550 is a single-chip transceiver that complies with the physical layer specifications for Universal Serial Bus (USB).

The MIC2550 supports full-speed (12Mbps) dual supply voltage operation (patent pending) and low-speed (1.5Mbps) operation.

A unique dual supply voltage operation allows the MIC2550 to reference the system I/F I/O signals to a supply voltage down to 2.5V while independently powered by the USB $\rm V_{BUS}$. This allows the system interface to operate at its core voltage without addition of buffering logic and also reduce system operating current.

Features

- Compliant to USB Specification Revision 2.0 for low-speed (1.5Mbps) and full-speed (12Mbps) operation
- Compliant to IEC-61000-4.2 (Level 2)
- Operation down to 2.5V
- Dual supply voltage operation
- Integrated speed-select termination supply
- Very low power consumption meets USB suspendcurrent requirements
- Small 14-pin TSSOP and 16-pin MLF™ packages

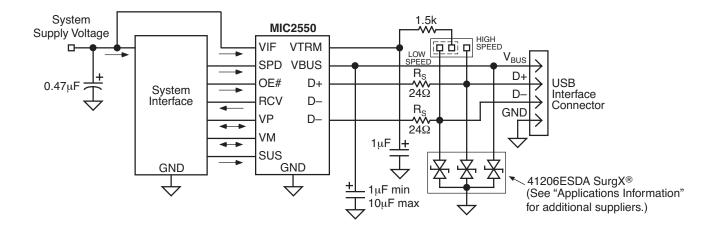

Applications

- · Personal digital assistants (PDA)
- · Palmtop computers
- Cellular telephones

Pin Configuration

14-Pin TSSOP (TM)

16-Pin MLF™ (ML)

Pin Description

Pin Name	Pin Number MIC2550BTS	Pin Number MIC2550BML	Pin Function	
VIF	1	15	System Interface Supply Voltage (Input): Determines logic voltage levels for system interface signaling to logic controller.	
SPD	2	1	Speed (Input): Edge rate control. Logic high selects full-speed edge rates. Logic low selects low-speed edge rates.	
RCV	3	2	Receive Data (Output): System interface receive data interface to logic controller.	
VP	4	3	Plus (Input/Output): System interface signal to logic controller. If OE# is logic 1, VP is a receiver output (+); If OE# is logic 0, VP is a driver input (+).	
VM	5	4	Minus (Input/Output): System interface signal to logic controller. If OE# is logic 1, VM is a receiver output (–); If OE# is logic 0, VM is a driver input (–).	
NC	6, 13	5, 8, 13 16	Not internally connected.	
GND	7	6	Ground: Power supply return and signal reference.	
SUS	8	7	Suspend (Input): Logic high turns off internal circuits to reduce supply current.	
OE#	9	9	Output Enable (Input): Active-low system interface input signal from logic controller. Logic low causes transceiver to transmit data onto the bus. Logic high causes the transceiver to receive data from the bus.	
D-	10	10	USB Differential Data Line – (Input/Output)	
D+	11	11	USB Differential Data Line + (Input/Output)	
VTRM	12	12	Termination Supply (Output): 3.3V speed termination resistor supply output.	
VBUS	14	14	USB Supply Voltage (Input): Transceiver supply.	

Absolute Maximum Ratings (Note 1)

Supply Voltage (V _{IF})	+6.5V
Input Voltage (V _{BUS})	0.5V(min)/5.5V(max)
Output Current (I _{D+} , I _{D-})	±50mA
Output Current (all others)	±15mA
Input Current	±50mA
Power Dissipation (P _D)	TBD
Storage Temperature (T _S)	–65° to +150°C
ESD, Note 3	
V _{BUS} , D+, D	±10kV

Operating Ratings (Note 2)

Supply Voltage (V _{BUS})	4.0V to 5.25V
Temperature Range (T _A)	40°C to +85°C
Junction Temperature (T _J)	160°C
Package Thermal Resistance	
TSSOP (θ _{JA})	100°C/W

Electrical Characteristics (Note 8)

 $T_A = 25^{\circ}\text{C}$, **bold** values indicate $-40^{\circ}\text{C} \le T_A \le +85^{\circ}\text{C}$; typical values at $V_{BUS} = 5.0\text{V}$, $V_{IF} = 3.0\text{V}$; minimum and maximum values at $V_{BUS} = 4.0\text{V}$ to 5.25V, $V_{IF} = 2.5\text{V}$ to 3.6V; unless noted.

Block Diagram

Applications Information

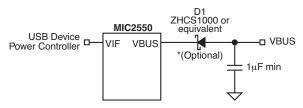

The MIC2550 is designed to provide USB connectivity in mobile systems where system supply voltages are not available to satisfy USB requirements. The MIC2550 can operate down to supply voltages of 2.5V and still meet USB physical layer specifications. As shown in the system diagram, the MIC2550 takes advantage of USB's supply voltage, V_{BUS} , to operate the transceiver. The system voltage, V_{IF} , is used to set the reference voltage used by the digital I/O lines (VP, VM, RCV, OE#, SPD, and SUS pins) interfacing to the system. Internal circuitry provides translation between the USB and system voltage domains. V_{IF} will typically be the main supply voltage rail for the system.

In addition, a 3.3V, 10% termination supply voltage, V_{TRM} , is provided to support speed selection. A $0.47\mu F$ (minimum) capacitor from V_{TRM} to ground is required to ensure stability. As shown in the typical application diagram, a $1\mu F$ capacitor is recommended. A 1.5K resistor is required between this pin and the D+ or D– lines to respectively specify full-speed or low-speed operation.

Power Supply Configurations

V_{IF}/V_{BUS} Switched

When the V_{BUS} input pin is pulled to ground a low impedance path between V_{IF} and V_{BUS} can cause a high current flow from V_{IF} to V_{BUS} thereby damaging the MIC2550. This issue can arise in systems where V_{BUS} is driven from a power supply that can be switched off such as in the case of a desktop PC. Adding a Schottky diode, such as the ZHCS1000 by Zetex, in series with V_{BUS} will prevent any current flow during this condition. A solution is shown in Figure 8 below.

Note: *(Optional) See Text - Power Supply Configurations

Figure 8. Solution to V_{IF}/V_{BUS} Switching

I/O Interface Using 3.3V

In systems where the I/O interface utilizes a 3.3V USB controller, an alternate solution is shown in Figure 9. This configuration has the advantage over Figure 8, in that no extra components are needed. Ensure that the load on V_{TRM} does not exceed 1mA total.

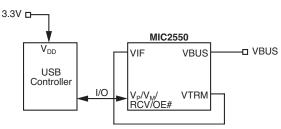

Figure 9. I/O Interface Uses 3.3V

Internal 3.3V Source

If the device is self-powered and has 3.3V available, the circuit in Figure 10 is yet another power supply configuration option. In this configuration, the internal regulator is disabled and the 3.3V source and not V_{BUS} powers the entire chip.

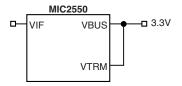

Figure 10. Powering Chip from Internal 3.3V Source

Suspend

When the suspend pin (SUS) is high, power consumption is reduced to a minimum. V_{TRM} is not disabled. RCV, V_P and V_M are still functional to enable the device to detect USB activity. For minimal current consumption in suspend mode, it is recommended that OE# = 1.

External ESD Protection

The use of ESD transient protection devices is not required for operation, but is recommended. We recommend the following devices or the equivalent:

Cooper Electronics Technologies (www.cooperet.com) 41206ESDA SurgX[®] 0805ESDA SurgX[®]

Littelfuse (www.littelfuse.com) V0402MHS05 SP0503BAHT

Non-Multiplexed Bus

To save pin count for the USB logic controller interface, the MIC2550 was designed with $V_{\rm P}$ and $V_{\rm M}$ as bidirectional pins. To interface the MIC2550 with a non-multiplexed data bus, resistors can be used for low cost isolation as shown in Figure 11.

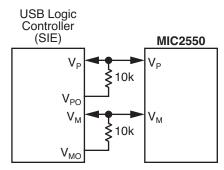

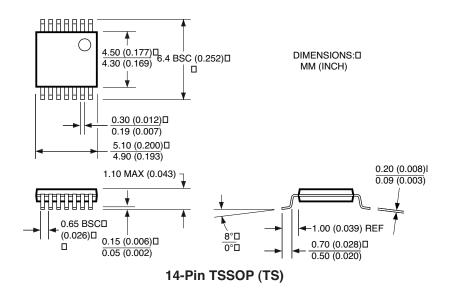

Figure 11. MIC2550 Interface to Non-Multiplexed Data Bus

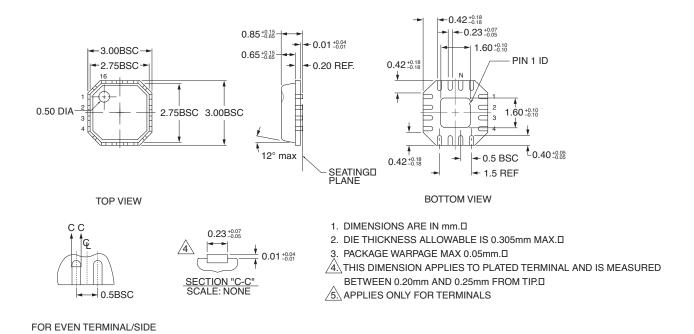

PCB Layout Recommendations

Although the USB standard and applications are not based in an impedance controlled environment, a properly designed PCB layout is recommended for optimal transceiver performance. The suggested PCB layout hints are as follows:

- Match signal line traces (VP/VM, D+, D-) to 40ps, approximately ¹/₃ inch if possible. FR-4 PCB material propagation is about 150ps/inch, so to minimize skew try to keep VP/VM, D+/Dtraces as short as possible.
- For every signal line trace width (w), separate the signal lines by 1.5–2 widths. Place all other traces at >2 widths from all signal line traces.
- Maintain the same number of vias on each differential trace, keeping traces approximately at same separation distance along the line.
- Control signal line impedances to ±10%.
- Keep R_S as close to the IC as possible, with equal distance between R_S and the IC for both D+ and D-.
