

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

### General Description

The MIC2551A is a single chip transceiver that complies with the physical layer specifications of the Universal Serial Bus (USB) 2.0. It supports both full speed (12Mbps) and low speed (1.5Mbps) operation and introduces superior edge rate control, producing crisper eye diagrams, which ease the task of passing USB compliance testing.

A unique, patented, dual supply voltage operation allows the MIC2551A to reference the system I/F I/O signals to a supply voltage down to 1.6V while independently powered by the USB  $V_{BUS}$ . This allows the system interface to operate at its core voltage without addition of buffering logic and also reduce system operating current.

### Features

- Compliant to USB Specification Revision 2.0 for full speed (12Mbps) and low speed (1.5Mbps) operation
- Compliant to IEC-61000-4.2 (Level 3)
- Separate I/O supply with operation down to 1.6V
- Integrated speed select termination supply
- Very-low power consumption to meet USB suspend-current requirements
- Small TSSOP and MLF<sup>®</sup> packages
- No power supply sequencing requirements
- Software controlled re-enumeration

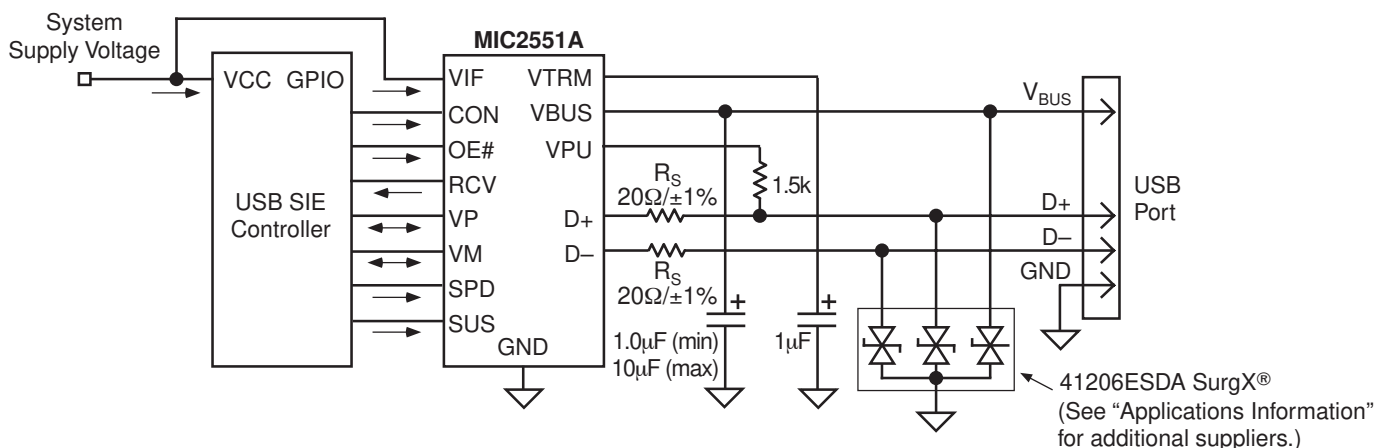

### Applications

- PDAs
- Palmtops
- Cell phones

### Ordering Information

| Part Number |             | Package                 |
|-------------|-------------|-------------------------|
| Standard    | Pb-Free     |                         |
| MIC2551ABTS | MIC2551AYTS | 14-Pin TSSOP            |
| MIC2551ABML | MIC2551AYML | 16-Pin MLF <sup>®</sup> |

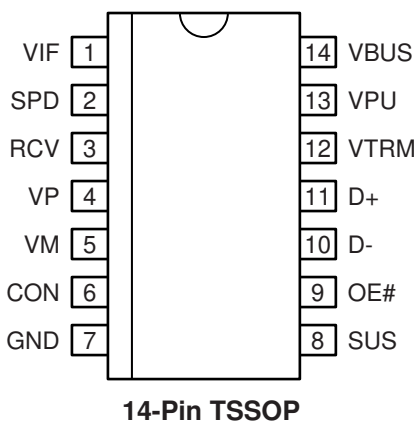

### Typical Application

Typical Application Circuit

## Pin Configuration

## Pin Description

| Pin Number<br>MIC2551ABTS | Pin Number<br>MIC2551ABML | Pin Name | I/O | Pin Function   |
|---------------------------|---------------------------|----------|-----|--|
| 1                         | 15                        | VIF      | I   | System Interface Supply Voltage: Used to provide reference supply voltage for system I/O interface signaling.  |
| 2                         | 1                         | SPD      | I   | Edge Rate Control: A logic HIGH operates at edge rates for "full speed" operation. A logic LOW operates edge rates for "low speed" operation.          |
| 3                         | 2                         | RCV*     | O   | Receive Data: Output for USB differential data.  |
| 4                         | 3                         | VP*      | I/O | If OE# = 1, VP = Receiver output (+)<br>If OE# = 0, VP = Driver input (+)  |
| 5                         | 4                         | VM*      | I/O | If OE# = 1 VM, = Receiver output (-)<br>If OE# = 0, VM = Driver input (-)  |
| 6                         | 5                         | CON      | I   | CONNECT (Input): Controls state of VPU. Refer to VPU pin description for detail.   |
| 7                         | 6                         | GND      |     | Ground Reference.  |
| 8                         | 7                         | SUS      | I   | Suspend: Active-High. Turns off internal circuits to reduce supply current.  |
| 9                         | 9                         | OE#*     | I   | Output Enable: Active-Low. Enables the transceiver to transmit data onto the bus. When inactive, the transceiver is in the receive mode.               |
| 10/11                     | 10/11                     | D-, D+*  | I/O | Differential data lines conforming to the USB standard.  |
| 12                        | 12                        | VTRM     | O   | 3.3V Reference Supply Output: Requires a minimum 0.1 $\mu$ F decoupling capacitor for stability. A 1 $\mu$ F capacitor is recommended                  |
| 13                        | 13                        | VPU      | O   | Pull-up Supply Voltage Output: Used to connect 1.5k $\Omega$ pull-up speed detect resistor. If CON = 1, VPU is high impedance. If CON = 0, VPU = 3.3V. |
| 14                        | 14                        | VBUS     | I   | USB Bus Supply Voltage: Used to power USB transceiver and internal circuitry.  |
|                           | 8,16                      | NC       |     | No connect.  |

\* See Table 1 for description of logic states.

| SUS | OE# | D+, D-    | RCV    | VP/VM      | Function   |
|-----|-----|-----------|--------|------------|--|
| 0   | 0   | Driving   | Active | Active     | Normal transmit mode.                                |
| 0   | 1   | Receiving | Active | Active     | Normal receive mode.                                 |
| 1   | 0   | Hi-Z      | 0      | Not active | Low power state.                                     |
| 1   | 1   | Hi-Z      | 0      | Active     | Receiving during suspend (low power state) (Note 1). |

Note 1. During suspend VP and VM are active in order to detect out-of-band signaling conditions.

## Applications Information

The MIC2551A is designed to provide USB connectivity in mobile systems where available system supply voltages are not able to satisfy USB requirements. The MIC2551A can operate down to supply voltages of 1.6V and still meet USB physical layer specifications. As shown in the circuit above, the MIC2551A takes advantage of the USB supply voltage,  $V_{BUS}$ , to operate the transceiver. The system voltage,  $V_{IF}$ , is used to set the reference voltage used by the digital I/O lines interfacing to the system controller. Internal circuitry provides translation between the USB and system voltage domains.  $V_{IF}$  will typically be the main supply voltage rail for the controller.

In addition, a 3.3V, 10% termination supply voltage, ( $V_{PU}$ ), is provided to support speed selection.  $V_{PU}$  can be disabled or enabled under software control via the CON input. This allows for software-controlled connect or disconnect states. A 1.5k resistor is required to be connected between this pin and the D+ or D- lines to respectively specify high speed or low speed operation.

The use of ESD transient protection devices is not required for operation, but is recommended. The MIC2551A is ESD rated for 11kV at the VBUS and D+, D- pins and 2kV for all other pins.

## Power Supply Configuration

The MIC2551A can be set up for different power supply configurations which modify the behavior of the device. Both  $V_{BUS}$  and  $V_{IF}$  have special thresholds that detect when they are either removed or grounded. Table 3 depicts the behavior under the different power supply configuration scenarios that are explained below.

### Normal Mode

$V_{BUS}$  is connected to the 5.0V USB bus voltage and  $V_{IF}$  is connected to a supply voltage in the range of 1.6V to 3.6V. In this case  $V_{TRM}$  supplies a 3.3V voltage for powering the speed select resistor via  $V_{PU}$  depending on the state of CON pin.

### Disconnect Mode

$V_{IF}$  is connected to a supply in a range of 1.6V to 3.6V and  $V_{BUS}$  is open or grounded. If  $V_{BUS}$  is opened while transmitting, the data lines (D+, D-) have sharing capability and may be driven with external devices up to approximately 3.6V if and only if SUSPEND is enabled ( $SUS = 1$ ). With  $V_{BUS}$  ground, D+, D- sharing mode is not permitted.

### Disable Mode

$V_{BUS}$  is connected to the 5.0V USB bus voltage and  $V_{IF}$  is open. All logic controlled inputs become high impedances, thus minimal current will be supplied by  $V_{IF}$  if the input pins are pulled up to an external source.

## Alternate Power Supply Configuration Options

### I/O Interface Using 3.3V

In systems where the I/O interface utilizes a 3.3V USB controller, an alternate solution is shown in Figure 7. No extra components are required; however, the load on  $V_{TRM}$  must not exceed 10mA.

Figure 7. I/O Interface Using 3.3V

### Signal Amplitude Respective to $V_{IF}$

When operating the MIC2551A, it is necessary to provide input signals which do not exceed  $V_{IF} + 0.3V$ .

## Suspend

When the suspend pin (SUS) is high, power consumption is reduced to a minimum.  $V_{TRM}$  is not disabled. RCV,  $V_P$  and  $V_M$  are still functional to enable the device to detect USB activity. For minimal current consumption in suspend mode, it is recommended that  $OE\# = 1$ , and  $SPD = 0$ .

## Speed

The speed pin (SPD) sets D+/D- output edge rates by increasing or decreasing biasing current sources within the output drivers. For low speed,  $SPD = 0$ . For full speed,  $SPD = 1$ . By setting  $SPD = 0$  during idle periods, in conjunction with suspend (SUS), the lowest quiescent current can be obtained. However, designers must provide a 300ns delay between changing SPD from 0 to 1 and transmission of data at full speed. This delay ensures the output drivers have arrived at their proper operating conditions. Failure to do so can result in leading edge distortion on the first few data bits transmitted.

## External ESD Protection

The use of ESD transient protection devices is not required for operation, but is recommended. We recommend the following devices or the equivalent:

0805ESDA SurgX<sup>®</sup>

Littelfuse ([www.littelfuse.com](http://www.littelfuse.com))

V0402MHS05  
SP0503BAHT

## Non-Multiplexed Bus

In order to save pin count for the USB logic controller interface, the MIC2551A was designed with  $V_P$  and  $V_M$  as bi-directional pins. To interface the MIC2551A with a non-multiplexed data bus, resistors can be used for low cost isolation as shown in Figure 8.

Figure 8. MIC2551A Interface to Non-Multiplexed Data Bus

| Configuration Mode         | VBUS/VTRM | VIF       | Notes  |
|----------------------------|-----------|-----------|--|
| Normal                     | Connected | Connected | Normal supply configuration and operation.   |
| Disconnect (D+/D- sharing) | Open      | Connected | $V_P/V_M$ are HIGH outputs, RCV is LOW. With $OE\# = 0$ and $SUS = 1$ , data lines may be driven with external devices up to 3.6V. With D+, D- floating, $I_{IF}$ draws less than 1 $\mu$ A. |
| Disconnect                 | Ground    | Connected | $V_P/V_M$ are HIGH outputs, RCV is LOW. With D+, D- floating, $I_{IF}$ draws less than 1 $\mu$ A.  |
| Disable Mode               | Connected | Open      | Logic controlled inputs pins are Hi-Z.   |
| Prohibited                 | Connected | Ground    | Prohibited condition.  |

Table 3. Power Supply Configuration

## PCB Layout Recommendations

Although the USB standard and applications are not based in an impedance controlled environment, a properly designed PCB layout is recommended for optimal transceiver performance. The suggested PCB layout hints are as follows:

- Match signal line traces (VP/VM, D+, D-) to 40ps, approximately  $\frac{1}{3}$  inch if possible. FR-4 PCB material propagation is about 150ps/inch, so to minimize skew try to keep VP/VM, D+/D- traces as short as possible.
- For every signal line trace width (w), separate the signal lines by 1.5 – 2 widths. Place all other traces at >2 widths from all signal line traces.
- Maintain the same number of vias on each differential trace, keeping traces approximately at same separation distance along the line.
- Control signal line impedances to  $\pm 10\%$ .
- Keep  $R_S$  as close to the IC as possible, with equal distance between  $R_S$  and the IC for both D+ and D-.

Package Information

14-lead TSSOP (TS)

TOP VIEW

BOTTOM VIEW

1. DIMENSIONS ARE IN mm.
2. DIE THICKNESS ALLOWABLE IS 0.305mm MAX.
3. PACKAGE WARPAGE MAX 0.05mm.
4. THIS DIMENSION APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.20mm AND 0.25mm FROM TIP.
5. APPLIES ONLY FOR TERMINALS

FOR EVEN TERMINAL/SIDE
