

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MIC94080/1/2/3/4/5

67mΩ R_{DS(on)} 2A High Side Load Switch
in 0.85mm x 0.85mm Thin MLF® Package

General Description

The MIC94080/1/2/3/4/5 is a family of high-side load switches designed to operate from 1.7V to 5.5V input voltage. The load switch pass element is an internal 67mΩ R_{DS(on)} P-Channel MOSFET which enables the device to support up to 2A of continuous current. Additionally, the load switch supports 1.5V logic level control and shutdown features in a tiny 0.85mm x 0.85mm 4-pin Thin MLF® package.

The MIC94080 and MIC94081 feature rapid turn on. The MIC94082 and MIC94083 provide a slew rate controlled soft-start turn-on of 800μs, while the MIC94084 and MIC94085 provide a slew rate controlled soft-start turn-on of 120μs. The soft-start feature is provided to prevent an in-rush current event from pulling down the input supply voltage.

The MIC94081, MIC94083, and MIC94085 feature an active load discharge circuit which switches in a 250Ω load when the switch is disabled to automatically discharge a capacitive load.

An active pull-down on the enable input keeps the MIC94080/1/2/3/4/5 in a default OFF state until the enable pin is pulled above 1.25V. Internal level shift circuitry allows low voltage logic signals to switch higher supply voltages. The enable voltage can be as high as 5.5V and is not limited by the input voltage.

The MIC94080/1/2/3/4/5 operating voltage range makes them ideal for Lithium ion and NiMH/NiCad/Alkaline battery powered systems, as well as non-battery powered applications. The devices provide low quiescent current and low shutdown current to maximize battery life.

Datasheets and support documentation can be found on Micrel's web site at: www.micrel.com.

Features

- 0.85mm x 0.85mm space saving 4-pin Thin MLF® package
- 1.7V to 5.5V input voltage range
- 2A continuous operating current
- 67mΩ R_{DS(on)}
- Internal level shift for CMOS/TTL control logic
- Ultra low quiescent current
- Micro-power shutdown current
- Soft-Start: MIC94082/3 (800μs), MIC94084/5 (120μs)
- Load discharge circuit: MIC94081, MIC94083, MIC94085
- Ultra fast turn off time
- Junction operating temperature from -40°C to +125°C

Applications

- Cellular phones
- Portable Navigation Devices (PND)
- Personal Media Players (PMP)
- Ultra Mobile PCs
- Portable instrumentation
- Other Portable applications
- PDAs
- GPS Modules
- Industrial and DataComm equipment

Typical Application

MIC94080 (ultra fast turn on)
MIC94082 (800μs soft-start)
MIC94084 (120μs soft-start)

MIC94081 (ultra fast turn on with auto-discharge)
MIC94083 (800μs soft-start with auto-discharge)
MIC94085 (120μs soft-start with auto-discharge)

Pin Description

Pin Number	Pin Name	Pin Function
1	V _{OUT}	Drain of P-Channel MOSFET.
2	GND	Ground should be connected to electrical ground.
3	V _{IN}	Source of P-Channel MOSFET.
4	EN	Enable (Input): Active-high CMOS/TTL control input for switch. Internal ~2M Ω Pull down resistor. Output will be off if this pin is left floating.

Absolute Maximum Ratings⁽¹⁾

Input Voltage (V_{IN})	+6V
Enable Voltage (V_{EN})	+6V
Continuous Drain Current (I_D) ⁽³⁾	
$T_A = 25^\circ\text{C}$	$\pm 2\text{A}$

$I_{SHUT-SWITCH}$	OFF State Leakage Current	$V_{IN} = +5.5\text{V}, V_{EN} = 0\text{V}, I_D = \text{SHORT}$ Measured on V_{OUT} , ⁽⁷⁾		0.02	1	μA
$R_{DS(ON)}$	P-Channel Drain to Source ON Resistance	$V_{IN} = +5.0\text{V}, I_D = -100\text{mA}, V_{EN} = 1.5\text{V}$		67	115	m Ω
		$V_{IN} = +4.5\text{V}, I_D = -100\text{mA}, V_{EN} = 1.5\text{V}$		70	130	m Ω
		$V_{IN} = +3.6\text{V}, I_D = -100\text{mA}, V_{EN} = 1.5\text{V}$		80	165	m Ω
		$V_{IN} = +2.5\text{V}, I_D = -100\text{mA}, V_{EN} = 1.5\text{V}$		110	225	m Ω
		$V_{IN} = +1.8\text{V}, I_D = -100\text{mA}, V_{EN} = 1.5\text{V}$		175	350	m Ω
		$V_{IN} = +1.7\text{V}, I_D = -100\text{mA}, V_{EN} = 1.5\text{V}$		200	375	m Ω
$R_{SHUTDOWN}$	Turn-Off Resistance	$V_{IN} = +3.6\text{V}, I_{TEST} = 1\text{mA}, V_{EN} = 0\text{V}$ MIC94081/3/5		250	400	Ω

Notes:

- Exceeding the absolute maximum rating may damage the device.
- The device is not guaranteed to function outside its operating rating.
- With thermal contact to PCB. See thermal considerations section.
- Pulse width <300 μs with < 2% duty cycle.
- Continuous body diode current conduction (reverse conduction, i.e. V_{OUT} to V_{IN}) is not recommended.
- Devices are ESD sensitive. Handling precautions recommended. HBM (Human body model), 1.5k Ω in series with 100pF.
- Measured on the MIC94080YFT.

Application Information

Power Switch SOA

The safe operating area (SOA) curve represents the boundary of maximum safe operating current and maximum safe operating junction temperature.

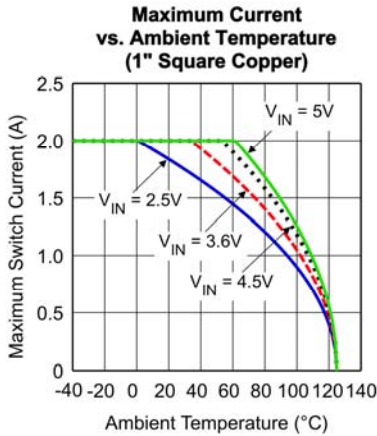

Figure 1. SOA Graph

The curves above show the SOA for various V_{IN} 's mounted on a typical 1 layer, 1 square inch copper board.

Power Dissipation Considerations

As with all power switches, the current rating of the switch is limited mostly by the thermal properties of the package and the PCB it is mounted on. There is a simple ohms law type relationship between thermal resistance, power dissipation and temperature, which are analogous to an electrical circuit:

Figure 2. Simple Electrical Circuit

From this simple circuit we can calculate V_X if we know I_{SOURCE} , V_Z and the resistor values, R_{XY} and R_{YZ} using the equation:

$$V_X = I_{SOURCE} \cdot (R_{XY} + R_{YZ}) + V_Z$$

Thermal circuits can be considered using these same rules and can be drawn similarly by replacing current sources with power dissipation (in Watts), resistance with thermal resistance (in °C/W) and voltage sources with temperature (in °C).

Figure 3. Simple Thermal Circuit

Now replacing the variables in the equation for V_X , we can find the junction temperature (T_J) from power dissipation, ambient temperature and the known thermal resistance of the PCB ($R_{\theta_{CA}}$) and the package ($R_{\theta_{JC}}$).

$$T_J = P_{DISS} \times (R_{\theta_{JC}} + R_{\theta_{CA}}) + T_A$$

P_{DISS} is calculated as $I_{SWITCH}^2 \times R_{SWmax}$. $R_{\theta_{JC}}$ is found in the operating ratings section of the datasheet and $R_{\theta_{CA}}$ (the PCB thermal resistance) values for various PCB copper areas is discussed in the document "Designing with Low Dropout Voltage Regulators" available from the Micrel website (LDO Application Hints).

Example:

A switch is intended to drive a 1A load and is placed on a printed circuit board which has a ground plane area of at least 25mm by 25mm (625mm²). The Voltage source is a Li-ion battery with a lower operating threshold of 3V and the ambient temperature of the assembly can be up to 50°C.

Summary of variables:

- $I_{SW} = 1A$
- $V_{IN} = 3V \text{ to } 4.2V$
- $T_A = 50^\circ C$
- $R_{\theta_{JC}} = 85^\circ C/W$
- $R_{\theta_{CA}} = 53^\circ C/W$ Read from Graph in Figure 4

Figure 4. Excerpt from the LDO Book

$$P_{DISS} = I_{SW}^2 \times R_{SWmax}$$

The worst case switch resistance (R_{SWmax}) at the lowest V_{IN} of 3V is not available in the datasheet, so the next lower value of V_{IN} is used.

$$R_{SWmax} @ 2.5v = 200m\Omega$$

If this were a figure for worst case R_{SWmax} for 25°C, an additional consideration is to allow for the maximum junction temperature of 125°C, the actual worst case

resistance in this case can be 30% higher (See R_{DSON} variance vs. temperature graph). However, 200m Ω is the maximum over temperature.

Therefore:

$$T_J = I^2 \times 0.2 \times (85+53) + 50$$

$$T_J = 78^\circ\text{C}$$

This is below the maximum 125°C.
