

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Secure click

PID: MIKROE-2522

Weight: 25 g

Secure click carries the ATECC508A cryptographic coprocessor with secure hardware-based key storage. The click is designed to run on either 3.3V or 5V power supply. It communicates with the target microcontroller over I2C interface.

ATECC508A features

Microchip's ATECC508A integrates ECDH (Elliptic Curve Diffie Hellman) security protocol, an ultra-secure method to provide key agreement for encryption/decryption. It also integrates the ECDSA (Elliptic Curve Digital Signature Algorithm) sign-verify authentication for the Internet of Things (IoT) market, including home automation, industrial networking, accessory and consumable authentication, medical, mobile and more.

The ATECC508A includes an EEPROM array which **can be used for storage of up to 16 keys**, certificates, miscellaneous read/write, read-only or secret data, consumption logging, and security configurations. Access to the various sections of memory can be restricted in a variety of ways and then the configuration can be locked to prevent changes.

It features a wide array of defense mechanisms specifically designed to prevent physical attacks on the device itself, or logical attacks on the data transmitted between the device and the system. Hardware restrictions on the ways in which keys are used or generated provide further defense against certain styles of attack.

Specifications

Type	EEPROM
Applications	IoT node security and ID, secure download and boot, ecosystem control, message security, anti-cloning, etc.
On-board modules	ATECC508A cryptographic co-processor
Key Features	Performs high-speed public key (PKI) algorithms, NIST Standard P256 elliptic curve support, SHA-256 hash algorithm with HMAC option, 256-bit key length, storage for up to 16 Keys
Interface	I2C
Input Voltage	3.3V or 5V
Click board size	M (42.9 x 25.4 mm)

Pinout diagram

This table shows how the pinout on **Secure click** corresponds to the pinout on the mikroBUS™ socket (the latter shown in the two middle columns).

Notes	Pin			Pin	Notes		
	NC	1	AN	PWM	16	NC	
	NC	2	RST	INT	15	NC	
	NC	3	CS	TX	14	NC	
	NC	4	SCK	RX	13	NC	
	NC	5	MISO	SCL	12	SCL	I2C clock
	NC	6	MOSI	SDA	11	SDA	I2C data
Power supply	+3.3V	7	3.3V	5V	10	+5V	Power supply
Ground	GND	8	GND	GND	9	GND	Ground

Jumpers and settings

Designator	Name	Default Position	Default Option	Description
JP1	PWR.SEL.	Left	3.3V	Power Supply Voltage Selection 3.3V/5V, left position 3.3V, right position 5V

Programming

Code examples for Secure click, written for MikroElektronika hardware and compilers are available on Libstock.

Code snippet

The following code snippet gets the public key from slot 0, generates the signature for a message using that key, and then verifies that signature.

```

01 if (atcab_get_pubkey(0, publicKeyBuffer) == ATCA_SUCCESS)
02     {
03         LOG( "rnrn Public key: " );
04         outputHex (publicKeyBuffer, 64);
05     }
06 else LOG( "rn Getting public key failed..." );
07 //Generates the signature from input message, using key in slot 0.
08 if (atcab_sign(0, messageBuffer, signatureBuffer) == ATCA_SUCCESS)
09     {
10         LOG( "rnrn Generating signature: " );
11         outputHex (signatureBuffer, 64);
12     }
13 else LOG( "rn Generating signature failed..." );
14 //Verification of signature
15 LOG( "rnrn Signature verification..." );
16 if (atcab_verify_extern(messageBuffer, signatureBuffer,
publicKeyBuffer, responseBuffer) == ATCA_SUCCESS)
17     {
18         if (responseBuffer [0])
19             LOG( "rn Signature is valid " );
20         else LOG( "rn Signature is invalid " );
21     }
22 else LOG( "rn Verification operation failed..." );

```
