

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# Keypad 4x4™

Manual

*All Mikroelektronika's development systems feature a large number of peripheral modules expanding microcontroller's range of application and making the process of program testing easier. In addition to these modules, it is also possible to use numerous additional modules linked to the development system through the I/O port connectors. Some of these additional modules can operate as stand-alone devices without being connected to the microcontroller.*

Additional board

SOFTWARE AND HARDWARE SOLUTIONS FOR EMBEDDED WORLD ...making it simple

## Keypad 4x4

*Keypad 4x4* is used for loading numerics into the microcontroller. It consists of 16 buttons arranged in a form of an array containing four lines and four columns. It is connected to the development system by regular IDC 10 female connector plugged in some development system's port.

Figure 1: Keypad 4x4

Figure 2: Keypad 4x4 connected to development system

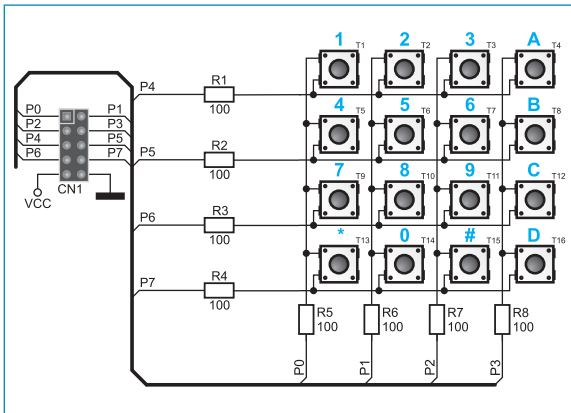

Figure 3: Keypad 4x4 connection schematic

A far easier way to load data by using keypad 4x4 is by employing ready-to-use functions provided in the *Keypad Library* of any Mikroelektronika's compiler. On the following pages there are three simple examples written for PIC16F887 microcontroller in *mikroC*, *mikroBasic* and *mikroPascal* programming languages. In all cases, the number loaded via keypad is converted into the equivalent ASCII code (0...9, A...F) and then it is displayed in the second line of LCD display. In this case, pull-down resistors are placed on output pins RD0 - RD3 and are used to determine logic zero (0) in idle state.

The keyboard is usually used as follows:

1. Four microcontroller's pins should be defined as outputs, and other four pins should be defined as inputs. In order the keypad to work properly, pull-down resistors should be placed on the microcontroller's input pins, thus defining logic state when no button is pressed.
2. Then, the output pins are set to logic one (1) and input pins' logic state is read. By pressing any button, a logic one (1) will appear on some input pin.
3. By combining zeros and ones on the output pins, it is determined which button is pressed.
