

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MLX90818

Absolute Pressure Sensor

1. Features and Benefits

- High accuracy absolute pressure sensor $\pm 0.5\%$ to $\pm 0.75\%$ for extended life operation at 150°C
- Digital SENT output with available compensated $\pm 1^{\circ}\text{C}$ accurate NTC temperature information
- System in a package: MEMS, analog front end circuitry, 16 bit microcontroller, voltage regulators, SENT driver
- Large automotive temperature range (-40°C to 150°C)
- Excellent harsh media compliance
- Automotive qualified and automotive diagnostic features (clamping levels, multiple internal fault diagnostics)
- Factory calibrated or fully programmable through the connector for customized calibration curves at customers
- Assembled in a rugged easy to use 4x5mm DFN package

2. Application Examples

- Automotive applications with absolute pressure from 1bar to 5.5bar
- Manifold and Turbo Manifold Air Pressure
- Manifold and Turbo Manifold Air Pressure combined with Temperature

3. Ordering information

Product Code	Temperature Code	Package Code	Option Code	Packing Form Code
MLX90818	L	XE	BAE-015	RE
MLX90818	L	XE	BAE-016	RE
MLX90818	L	XE	BAE-017	RE

Legend:

Temperature Code: L (-40°C to 150°C)

Package Code: XE = DFN14

Option Code: BAE-015 = 0.1 to 4bar absolute pressure / 193 to 3896LSB SENT output / no NTC

BAE-016 = 0.1 to 3bar absolute pressure / 193 to 3896LSB SENT output / NTC

BAE-017 = 0.1 to 4bar absolute pressure / 193 to 3896LSB SENT output / NTC

Packing Form: RE = Reel

Ordering example: MLX90818LXE-BAE-015-RE

4. Functional Diagram

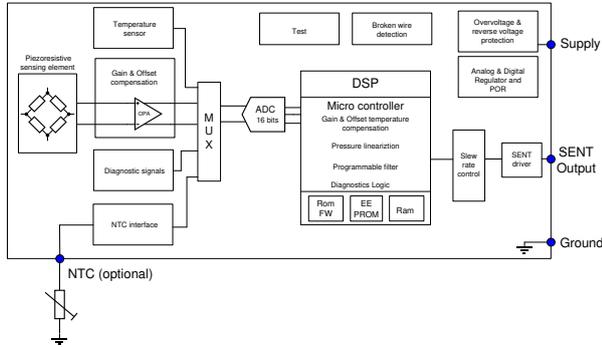

Figure 1: Functional block diagram

5. General Description

The MLX90818 is a packaged, factory calibrated, absolute pressure sensor delivering a digital output signal using the SENT protocol.

Use of an optimized architecture and a high density CMOS technology imparts the MLX90818 with best in class automotive EMC performance. A DSP based architecture using a 16bit microcontroller provides outstanding performance in terms of initial accuracy.

A smart package and die assembly concept suits applications with stringent automotive temperature and stress conditions needing small drift over life.

10. Detailed General Description

The MLX90818 contains a pressure sensing element which consists of a diaphragm realized in the silicon chip by wafer bonding on an etched cavity with built in reference vacuum. The diaphragm reacts to a change in absolute pressure. The internal strain increases, in particular at the border of the diaphragm. Here, the piezo-resistive elements have been implanted into the silicon diaphragm forming a Wheatstone bridge, which act as a transducer.

The electronics front end amplifies the signal from the bridge, performs a coarse offset compensation and an ADC conversion. The DSP performs the compensations over temperature. Furthermore, the digital circuit provides some filtering, the possibility to linearize the pressure signal and also implements the clamping function. This chip delivers a SENT output compliant with SAE J2716 spec dated April 2016. On one of the fast channels of the SENT message it is possible to select to transmit linearized and calibrated temperature information measured by an external NTC thermistor. An analog interface is available for the external thermistor and the 16bits DSP performs the calibration and linearization of the measured thermistor temperature.

Extensive protection of the supply lines allows the MLX90818 to handle extreme overvoltage conditions and is immune to severe external disturbances. Several diagnostic functions (over-voltage, under-voltage, overpressure, under pressure detections) have been implemented on the 90818 and can be enabled by programming EEPROM settings. Figure 4 describes MLX90818 block diagram.

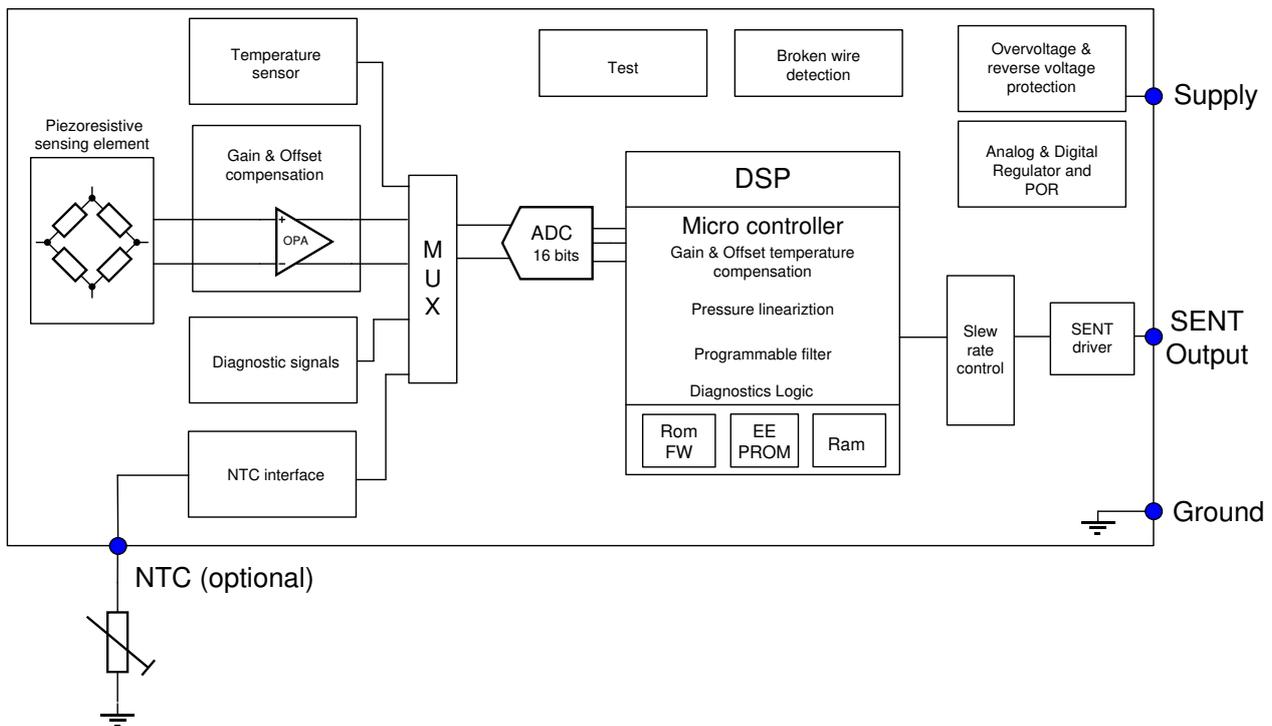

Figure 4: MLX90818 block diagram

11. Default programmed settings

The MLX90818 is calibrated at the final manufacturing test steps. During the calibration, settings are stored in the on chip EEPROM to define the pressure transfer curve. Besides pressure, the internal temperature and optionally the NTC temperature calibrations are performed. The default temperature characteristic can be found in the graph of Figure 5. The SENT parameters and the IC filter values are also configured.

12. Filters

There are two filters available to filter the pressure signal. The first filter is a Small Signal Filter which can be disabled or enabled. The second filter is a first order low pass filter for the pressure signal which has a programmable depth.

An overview of the noise levels using different filter and gain combinations can be found in Table 9.

12.1. PFLT

PFLT is a programmable first order low pass filter. The depth of this filter can be selected. This filter can be configured to select the optimal trade-off between response time and output noise.

The low pass filter is implemented according to the following formula:

$$Filter_{output}(k) = \frac{Filter_{input}(k) - Filter_{output}(k - 1)}{2^{PFLT}} + Filter_{output}(k - 1)$$

The PFLT parameter in the formula is set in EEPROM and can have a value between 0 and 9. An overview of typical response times when applying a step on the input using different PFLT filter settings can be found in Table 8. The number of SENT frames indicated in the table includes the last frame which contains stable pressure data. Filter setting 0 disables the PFLT.

PFLT setting	Response time in SENT frames ⁽⁴⁾
0	3
1	3
2	4
3	7
4	13
5	23
6	45
7	88
8	173
9	346

Table 8: Filter settings with corresponding typical response times

12.2. SSF

The SSF (Small Signal Filter) is a digital filter which is designed not to have an impact on the response time of a fast changing pressure signal like a pressure step. When a large signal change at the input is present, the filter is bypassed and not filtering the signal. For small signal changes, which are in most cases noise, the filter is used and filtering the pressure signal.

⁴ Tick time is set to 3µs and Pause Pulse is enabled.

The Small Signal Filter can be enabled or disabled in EEPROM. It is advised not to use the SSF in combination with the PFLT enabled.

Analog front end gain (CG)	Digital gain (G0)	PFLT setting	SSF	Noise (LSB pk-pk)

Table 9: Filter settings and gain combinations with corresponding pressure noise values

13. Analog Front End

The analog front end of the MLX90818 consists of a chopping stage and 3 amplification stages as can be seen in Figure 9. There are also several input diagnostics integrated into this front end to be able to detect a broken InP or InN connection or an input which is out of range. This diagnostic information is transferred to the microcontroller to handle further action for example flagging a diagnostic message.

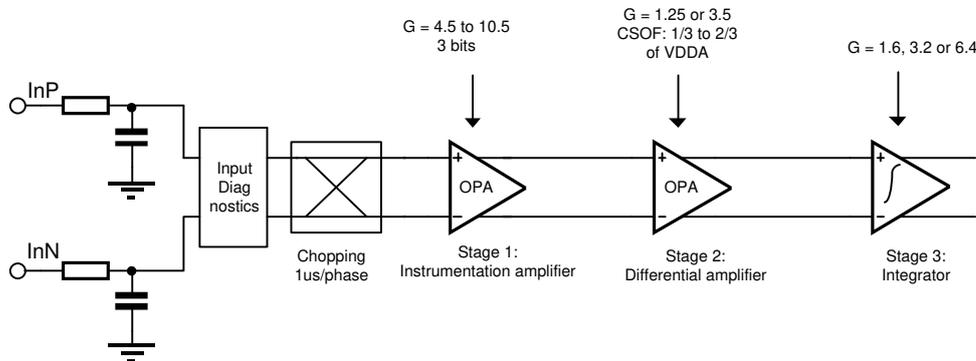

Figure 9: Analog front end block diagram

The first stage is an instrumentation amplifier of which the gain can be programmed using 3 bits to cover a gain range between 4.5 and 10.6.

Transfer equation:

$$\text{OUTP1} - \text{OUTN1} = \text{Gst1} * (\text{InP} - \text{InN}) \text{ in phase 1}$$

$$\text{OUTP1} - \text{OUTN1} = \text{Gst1} * (\text{InN} - \text{InP}) \text{ in phase 2}$$

The second stage is a fully differential amplifier. The gain of the amplifier can be calibrated using 1 bit.

Transfer equation:

$$\text{OUTP2} - \text{OUTN2} = -\text{Gst2} * (\text{OUTP1} - \text{OUTN1}) - \text{Gst2} * (\text{CSOF1} - \text{CSOF2}) \text{ in phase 1}$$

$$\text{OUTP2} - \text{OUTN2} = -\text{Gst2} * (\text{OUTN1} - \text{OUTP1}) - \text{Gst2} * (\text{CSOF2} - \text{CSOF1}) \text{ in phase 2}$$

The CSOF1 and CSOF2 signals are generated by the coarse offset DAC with the following transfer functions:

$$\text{CSOF1} = \frac{\text{VDDA}}{2} + (-1)^{\text{CO7}} * \left(\frac{2}{3} - \frac{1}{3} \right) * \frac{\text{VDDA}}{2} * \frac{\text{CO}[6:0]}{127}$$

$$\text{CSOF2} = \frac{\text{VDDA}}{2} - (-1)^{\text{CO7}} * \left(\frac{2}{3} - \frac{1}{3} \right) * \frac{\text{VDDA}}{2} * \frac{\text{CO}[6:0]}{127}$$

CO[6:0] fixes the DAC output. CO7 is used for the polarity.

The third stage is an integrator which is controlled using 2 bits to set a gain between 1.6 and 6.4

Transfer equation at the outputs of the amplifier:

$$\text{OUTP3} - \text{OUTN3} = -N * (\text{C1}/\text{C2}) * (\text{OUTP2} - \text{OUTN2})$$

$$\text{OUTP3_common_mode} \text{ and } \text{OUTN3_common_mode} = \text{VCM} = \text{VDDA}/2$$

In this equation N represents the number of integration cycles which is a fixed value of N = 40.

C2 is a fixed feedback capacitor of approximately 5pF. C1 can have 3 different values: 0.2pF, 0.4pF or 0.8pF.

Transfer equation after the ADC:

$$\text{Pressure_ADC} = ((\text{OUTN3} - \text{OUTP3}) * 2^{16} / \text{VDDA}) + 32768$$

An overview of all possible values for Gst1, Gst2 and Gst3 can be found in Table 10 below.
The input stage is designed to work with an input common-mode voltage range between 42%Vbrg and 58%Vbrg.

Gain setting [-]	Gst1 [V/V]	Gst2 [V/V]	Gst3 [V/V]	Total gain [V/V]	FS Differential Input Signal [mV]

31	10.6	-3.5	6.4	-237.4	± 7

Table 10: Gain and input signal range of the analog front end

14. ADC

The 16 bit differential ADC has a range from $-VDDA/2$ to $+VDDA/2$.

There are 7 different ADC channels. Channel 0 is not used. Table 11 below describes all the channels.

ADC	Signal	Remarks
SIN[2:0]		
0	-	Nothing connected
1	P	Pressure
2	Tint	Internal Temperature
3	Vsup	External Supply
4	InP/InN	Multiplexing between Positive/Negative Sensor Output
5	Vdig	Digital Regulator
6	Tntc	NTC Output
7	VBE	Internal Voltage

Table 11: ADC channels

The different channels are converted in a constantly repeating sequence at a rate of 50µsec for each individual conversion. The order is shown in Figure 10 below.

Figure 10: ADC sequence

15. Digital

The digital is built around a 16-bit microcontroller. It contains besides the processor also ROM, RAM and EEPROM and a set of user and system IO registers.

Temperature compensation of the pressure signal and pressure linearization is handled by the microcontroller. For the pressure compensation there are EEPROM parameters allocated to be able to cover a large variety of calibration approaches.

Both for gain and offset of the pressure signal, there is a separate temperature dependency programmable ranging from a temperature independence to a first order, second order and finally a third order compensation. This is reflected in EEPROM parameters for the offset (O0, O1, O2 and O3) and for the gain (G0, G1, G2 and G3). If required, the linearity of the pressure signal can also be compensated without a temperature dependency or with a first order temperature dependency through EEPROM parameters L0 and L1.

Linearization of the NTC temperature is also covered partially by the microcontroller. More information in this topic can be found in chapter 16.

16. NTC Temperature Linearization

The linearization of the NTC temperature signal is split up in several stages. A schematic overview of these steps can be seen in Figure 11.

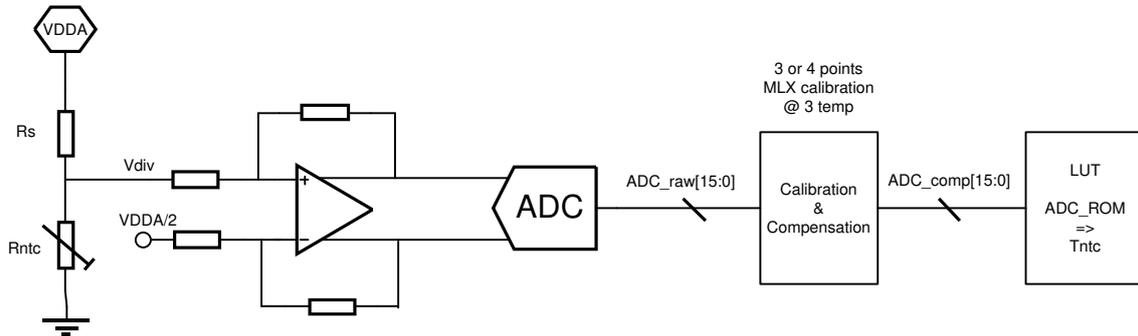

Figure 11: Block diagram NTC linearization

The complete system can be divided into 5 separate stages.

1. A resistor divider with internal resistor R_s is used to linearize R_{ntc} into a voltage.
2. A fully differential amplifier with unity gain is used to drive the ADC.
3. The 16-bit ADC is being used to convert the analog resistor divider output voltage into a digital signal called ADC_raw .
4. With the help of calibration data saved in EEPROM the microcontroller will perform a first compensation on ADC_raw converting it to ADC_comp . This new value is targeted to be as close as possible to the value ADC_ROM .
5. Finally a look up table (LUT) will be used to convert the ADC_ROM values into the T_{ntc} value which is the desired linearized NTC temperature.

The default NTC characteristic which is calibrated on option codes BAE-016 and BAE-017 can be found in Table 12. When using an NTC which does not match the coefficients described above, it is advised to contact Melexis.

The EEPROM coefficients which are used for the conversion from ADC_raw to ADC_comp are N_0 to N_3 , $N_0_Diff_Low$ to $N_3_Diff_Low$, $N_0_Diff_High$ to $N_3_Diff_High$ and $TEMP1$ to $TEMP3$.

Table 12: Default NTC characteristic

17. SENT Configuration

The SENT output is designed to be compliant with the SAE J2716 rev. Apr 2016 SENT standard. The tick time is configurable in EEPROM using parameter TICK_DIV. The available tick time settings are 3us, 4us, 6us, 10us, 12us and 16us. A pause pulse can also be enabled to have a fixed frame length of 282 ticks. This can be done using parameter PAUSE.

In the default configuration a tick time of 3us is selected and the pause pulse is enabled.

17.1. Fast Channel Configuration

On the fast channel, 8 different options are available to configure channel 1 and channel 2. An overview of these different options and how to configure them can be found in Table 13.

#	FC_CFG setting	Fast Channel 1	Fast Channel 2	Remark	Default Configuration ⁽⁵⁾
1	0	Pressure (3x 4 bit)	Inverse of Pressure (3x 4 bit)		
2	1	Pressure (3x 4 bit)	Rolling counter (2x 4 bit) and inverse of MSN of Pressure (1x 4 bit)		BAE-015
3	2	Pressure (3x 4 bit)	Medium temperature (3x 4 bit)	NTC temperature	BAE-016, BAE-017
4	3	Pressure (3x 4 bit)	Internal temperature (3x 4 bit)	PTAT temperature	
5	4	Pressure only (3x 4 bit)	/		
6	5	Pressure only (4x 3 bit)	/		
7	6	Data indicated by pointer 1 (3x 4 bit)	Data indicated by pointer 2 (3x 4 bit)	In this mode no diagnostics are available. FC configuration only used by Melexis.	
8	7	Pressure (3x 4 bit)	0 (3x 4 bit)		

Table 13: Fast channel configuration options

The selection of the fast channel output mode can be done by changing the parameter 'FC_CFG' in the EEPROM.

17.2. Slow Channel Configuration

The Slow Serial Channel is implemented according to the Enhanced Serial Message Format using 12 bit data and 8 bit message ID as described in the reference SENT protocol standard SAE J2716 rev. Apr 2016.

An overview of the different slow channel messages which are available in the MLX90818 can be found in Table 14. From this table 16 messages can be configured completely in EEPROM. The 12 bit data content of these messages can be configured freely. The ID of programmable message PR0, PR1, PR2 and PR3 is copied from EEPROM (2x 4 bit). The ID of PR5 is 1 bit higher than of PR4. The same is valid for the other pairs: PR6-7, PR8-9, ..., PR14-15. This programmable ID is indicated in Table 14 as 0xYZ.

All programmable messages can also be enabled and disabled, but not all independently of each other:

- PR0, PR1, PR2 and PR3 can be each independently enabled or disabled
- PR4 and PR5 are together enabled or disabled
- PR6 and PR7 are together enabled or disabled
- PR8, PR9, PR10 and PR11 are together enabled or disabled
- PR12, PR13, PR14 and PR15 are together enabled or disabled

⁵ MLX90818 Option Code default configuration

#	Type	ID	Description	Data	Rep

35	RAM	0xE1	Device start-up check	Start-up self-check result data	N

Table 14: Slow channel messages

Messages which have a “Y” in the column Rep of Table 14 can be selected to have a higher occurrence in the slow channel message sequence. Their repetition rate can be configured as indicated in Table 15. The repeatable messages MID01h, MID10h and MID23h can be configured individually to have their own repetition rate. The repetition factor setting can be done in respectively “SENT_REP_FACT_ID_01”, “SENT_REP_FACT_ID_10” and “SENT_REP_FACT_ID_23”.

Repetition Factor Setting	Real Repetition Factor
0	Message repetition disabled
1	Message repeat every 2 messages
2	Message repeat every 3 messages
3	Message repeat every 4 messages
4	Message repeat every 5 messages
5	Message repeat every 6 messages
6	Message repeat every 7 messages
7	Message repeat every 8 messages
8	Message repeat every 9 messages
9	Message repeat every 10 messages
10	Message repeat every 12 messages
11	Message repeat every 16 messages
12	Message repeat every 20 messages
13	Message repeat every 24 messages
14	Message repeat every 28 messages
15	Message repeat every 30 messages

Table 15: Repetition rate settings

Absolute Pressure Sensor

Once a message is configured to be repeatable, it will automatically have the highest priority. Therefore it will appear first in the slow message sequence.

The priority order between MID01, MID10 and MID23 can also be configured using EEPROM parameter “SC_R_O”:

- SC_R_O = 0: Priority order: ID01h > ID10h > ID23h (default setting)
- SC_R_O = 1: Priority order: ID10h > ID23h > ID01h

An overview of the default slow channel configurations for our different option codes can be found in Table 16.
