Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

±2g/±4g/±8g Three Axis Low-g Digital Output Accelerometer

MMA7456L

The MMA7456L is a Digital Output (I²C/SPI), low power, low profile capacitive micromachined accelerometer featuring signal conditioning, a low pass filter, temperature compensation, self-test, configurable to detect 0g through interrupt pins (INT1 or INT2), and pulse detect for quick motion detection. 0g offset and sensitivity are factory set and require no external devices. The 0g offset can be customer calibrated using assigned 0g registers and g-Select which allows for command selection for 3 acceleration ranges (2g/4g/8g). The MMA7456L includes a Standby Mode that makes it ideal for handheld battery powered electronics.

**MMA7456L: XYZ-AXIS
ACCELEROMETER
±2g/±4g/±8g**

Features

- Digital Output (I²C/SPI)
- 3mm x 5mm x 1mm LGA-14 Package
- Self-Test for Z-Axis
- Low Voltage Operation: 2.4 V – 3.6 V
- User Assigned Registers for Offset Calibration
- Programmable Threshold Interrupt Output
- Level Detection for Motion Recognition (Shock, Vibration, Freefall)
- Pulse Detection for Single or Double Pulse Recognition
- Sensitivity (64 LSB/g @ 2g and @ 8g in 10-Bit Mode)
- Selectable Sensitivity (±2g, ±4g, ±8g) for 8-bit Mode
- Robust Design, High Shocks Survivability (5,000g)
- RoHS Compliant
- Environmentally Preferred Product
- Low Cost

Bottom View

**14 LEAD
LGA
CASE 1977-01**
Typical Applications

- Cell Phone/PMP/PDA: Image Stability, Text Scroll, Motion Dialing, Tap to Mute
- HDD: Freefall Detection
- Laptop PC: Freefall Detection, Anti-Theft
- Pedometer
- Motion Sensing, Event Recorder

Table 1. Pin Descriptions

Pin #	Pin Name	Description	Pin Status
1	DVDD_IO	Digital Power for I/O pads	Input
2	GND	Ground	Input
3	N/C	No internal connection. Leave unconnected or connect to Ground.	Input
4	IADDR0	I^2C Address Bit 0 (optional)*	Input
5	GND	Ground	Input
6	AVDD	Analog Power	Input
7	$\overline{CS}$	SPI Enable (0), I^2C Enable (1)	Input
8	INT1/DRDY	Interrupt 1/ Data Ready	Output
9	INT2	Interrupt 2	Output
10	N/C	No internal connection. Leave unconnected or connect to Ground.	Input
11	N/C	Leave unconnected or connect to Ground.	Input
12	SDO	SPI Serial Data Output	Output
13	SDA/SDI/SDO	I^2C Serial Data (SDA), SPI Serial Data Input (SDI), 3-wire interface Serial Data Output (SDO)	Open Drain/Input/Output
14	SCL/SPC	I^2C Serial Clock (SCL), SPI Serial Clock (SPC)	Input

*This address selection capability is not enabled at the default state. If the user wants to use it, factory programming is required. If activated (pin 4 on the device is active).

<$1D = 0001 1101 > bit 0 is V_{DD} on pin 4

<$1C = 0001 1100 > bit 0 is GND on pin 4. If the pin is programmed it cannot be left NC.
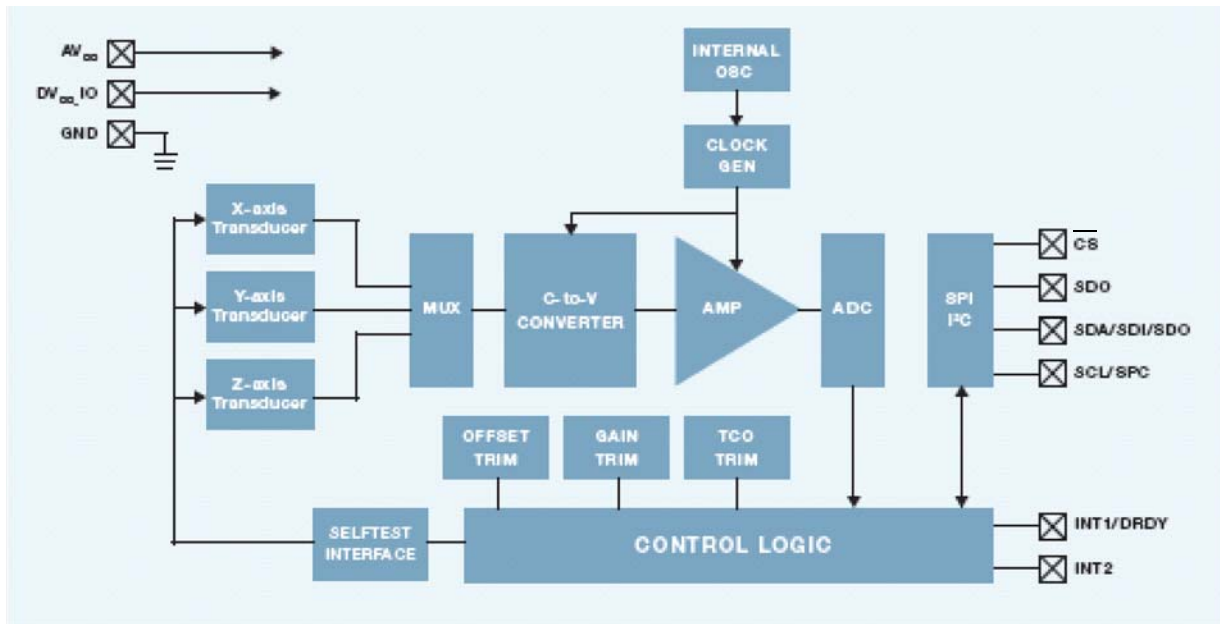

Figure 2. Simplified Accelerometer Functional Block Diagram

Table 2. Maximum Ratings

(Maximum ratings are the limits to which the device can be exposed without causing permanent damage.)

Rating	Symbol	Value	Unit
Maximum Acceleration (all axes)	g_{max}	5000	g
Analog Supply Voltage	AV_{DD}	-0.3 to +3.6	V
Digital I/O pins Supply Voltage	DV_{DD_IO}	-0.3 to +3.6	V
Drop Test	D_{drop}	1.8	m
Storage Temperature Range	T_{stg}	-40 to +125	°C

ELECTRO STATIC DISCHARGE (ESD)

WARNING: This device is sensitive to electrostatic discharge.

Although the Freescale accelerometer contains internal 2000V ESD protection circuitry, extra precaution must be taken by the user to protect the chip from ESD. A charge of over 2000 volts can accumulate on the human body or associated test equipment. A charge of this magnitude can alter the performance or cause failure of the chip. When handling the accelerometer, proper ESD precautions should be followed to avoid exposing the device to discharges which may be detrimental to its performance.

Table 3. Operating Characteristics

Table 4. Function Parameters for Detection

–40°C $\leq T_A \leq$ 85°C, 2.4 V $\leq AV_{DD} \leq$ 3.6 V, unless otherwise specified

Characteristic	Symbol	Min	Typ	Max	Unit
Level Detection					
Detection Threshold Range		0	—	FS	g
Pulse Detection					
Pulse detection range (Adjustable range)		0.5	—	127	ms
Time step for pulse detection		—	0.5	—	ms
Threshold range for pulses		0	—	FS	g
Detection levels for threshold		—	127	—	Counts
Latency timer (Adjustable range)		1	—	150	ms
Time Window (Adjustable range)		1	—	250	ms
Bandwidth for detecting interrupt*		—	600	—	Hz
Time step for latency timer and time window		—	1	—	ms

Note: The response time is between 10% of full scale V_{DD} input voltage and 90% of the final operating output voltage.

*The bandwidth for detecting interrupts in level and pulse is 600Hz which is changed from measurement mode.

PRINCIPLE OF OPERATION

The Freescale accelerometer is a surface-micromachined integrated-circuit accelerometer. The device consists of a surface mi-cromachined capacitive sensing cell (g-cell) and a signal conditioning ASIC contained in a single package. The sensing element is sealed hermetically at the wafer level using a bulk micromachined cap wafer. The g-cell is a mechanical structure formed from semiconductor materials (polysilicon) using semiconductor processes (masking and etching). It can be modeled as a set of beams attached to a movable central mass that move between fixed beams. The movable beams can be deflected from their rest position by subjecting the system to an acceleration (Figure 3).

As the beams attached to the central mass move, the distance from them to the fixed beams on one side will increase by the same amount that the distance to the fixed beams on the other side decreases. The change in distance is a measure of accel-eration. The g-cell beams form two back-to-back capacitors (Figure 3). As the center beam moves with acceleration, the distance between the beams changes and each capacitor's value will change, $(C = A\varepsilon/D)$. Where A is the area of the beam, ε is the di-electric constant, and D is the distance between the beams.

The ASIC uses switched capacitor techniques to measure the g-cell capacitors and extract the acceleration data from the differ-ence between the two capacitors. The ASIC also signal conditions and filters (switched capacitor) the signal, providing a digital output that is proportional to acceleration.
Figure 3. Simplified Transducer Physical Model

FEATURES

Self-Test

The sensor provides a self-test feature that allows the verification of the mechanical and electrical integrity of the accelerometer at any time before or after installation. This feature is critical in applications such as hard disk drive protection where system integrity must be ensured over the life of the product. When the self-test function is initiated through the mode control register ($16), accessing the "self-test" bit, an electrostatic force is applied to each axis to cause it to deflect. The Z-axis is trimmed to deflect 1g. This procedure assures that both the mechanical (g-cell) and electronic sections of the accelerometer are functioning.

g-Select

The g-Select feature enables the selection between 3 acceleration ranges for measurement. Depending on the values in the Mode control register ($16), the MMA7456L's internal gain will be changed allowing it to function with a 2g, 4g or 8g measurement sensitivity. This feature is ideal when a product has applications requiring two or more acceleration ranges for optimum performance and for enabling multiple functions. The sensitivity can be changed during the operation by modifying the two GLVL bits located in the mode control register.

$16: Mode Control Register (Read/Write)

D7	D6	D5	D4	D3	D2	D1	D0	Bit
--	DRPD	SPI3W	STON	GLVL[1]	GLVL[0]	MODE[1]	MODE[0]	Function
0	0	0	0	0	0	0	0	Default

Table 5. Configuring the g-Select for 8-bit output using Register $16 with GLVL[1:0] bits

GLVL [1:0]	g-Range	Sensitivity
00	8g	16 LSB/g
01	2g	64 LSB/g
10	4g	32 LSB/g

Standby Mode

This digital output 3-axis accelerometer provides a standby mode that is ideal for battery operated products. When standby mode is active, the device outputs are turned off, providing significant reduction of operating current. When the device is in standby mode the current will be reduced to 2.5 µA typical. In standby mode the device can read and write to the registers with the I²C/SPI available, but no new measurements can be taken in this mode as all current consuming parts are off. The mode of the device is controlled through the mode control register by accessing the two mode bits as shown in Table 6.

Table 6. Configuring the Mode using Register $16 with MODE[1:0] bits

MODE [1:0]	Function
00	Standby Mode
01	Measurement Mode
10	Level Detection Mode
11	Pulse Detection Mode

Measurement Mode

During measurement mode, continuous measurements on all three axes enabled. The g-range for 2g, 4g, or 8g are selectable with 8-bit data and the g-range of 8g is selectable with 10-bit data. The sample rate during measurement mode is 125 Hz with 62.5 BW filter selected. The sample rate is 250 Hz with the 125 Hz filter selected. Therefore, when a conversion is complete (signaled by the DRDY flag), the next measurement will be ready.

When measurements on all three axes are completed, a logic high level is output to the DRDY pin, indicating "measurement data is ready." The DRDY status can be monitored by the DRDY bit in Status Register (Address: $09). The DRDY pin is kept high until one of the three Output Value Registers are read. If the next measurement data is written before the previous data is read, the DOVR bit in the Status Register will be set. Also note that in measurement mode, level detection mode and pulse detection mode are not available.

By default all three axes are enabled. X and/or Y and/or Z can be disabled. There is a choice between detecting an absolute signal or a positive or negative only signal on the enabled axes. There is also a choice between doing a detection for motion where X or Y or Z > Threshold vs. doing a detection for freefall where X & Y & Z < Threshold.

MMA7456L

LEVEL DETECTION

When in Level or Pulse detection mode, it is not advisable to read the XYZ measurements because this can conflict with timing. The interrupts for level and pulse detection are at 600 Hz, while measurement mode is at 125 Hz. It is best to exit the pulse/level mode before taking a measurement on the XYZ.

Both the Level Detection and Pulse Detection modes can trigger an interrupt. Typically one interrupt is assigned to either pulse detection or level detection. To detect both at the same time 2 interrupts are required. The level detection mechanism has no timers associated with it. Once a set acceleration level is reached the interrupt pin will go high and remain high until the interrupt pin is cleared (See Assigning, Clearing & Detecting Interrupts).

By default all three axes are enabled and the detection range is 8g only. X and/or Y and/or Z can be disabled. There is a choice between detecting an Absolute signal or a Positive or Negative only signal on the enabled axes. There is also a choice between doing a detection for Motion where X or Y or Z > Threshold vs. doing a detection for Freefall where X& Y & Z < Threshold.

$18: Control 1 (Read/Write) Setting the Detection Axes for X, Y and Z

This allows the user to define how many axes to use for detection. All axes are enabled by default. To disable write 1.

XDA: Disable X

YDA: Disable Y

ZDA: Disable Z

0	0	0	0	0	0	0	0	Default

LDTH[7:0]: Level detection threshold value. If THOPT bit in Detection Control Register is "0", it is unsigned 7 bits value and LDTH[7] should be "0". If THOPT bit is "1", it is signed 8 bits value.

MMA7456L

THRESHOLD DETECTION FOR MOTION AND FREEFALL CONDITIONS

CASE 1: Motion Detection

Integer Value: X >Threshold **OR** Y >Threshold **OR** Z > Threshold

Reg $18 THOPT=1; Reg 19 LDPL=0, Set Threshold to 3g, which is 47 counts (16 counts/g). Set register $1A LDTH = $2F.
TH = $2F

CASE 2: Motion Detection

Absolute: ||X|| > Threshold **OR** ||Y|| >Threshold **OR** ||Z|| > Threshold

Reg $18 THOPT=0; Reg 19 LDPL=0, Set Threshold to 3g, which is 47 counts (16 counts/g). Set register $1A LDTH = $2F.

TH = $2F

TH = $D1
CASE 3: Freefall Detection

Integer Value: X < Threshold **AND** Y < Threshold **AND** Z <Threshold

Reg $18 THOPT=1; Reg 19 LDPL=1, Set Threshold to 0.5g, which is 7 counts (16 counts/g). Set register $1A LDTH = $07
TH = $07

CASE 4: Freefall Detection

Absolute: ||X|| <Threshold **AND** ||Y|| < Threshold **AND** ||Z||< Threshold

Reg $18 THOPT=0; Reg 19 LDPL=1, Set Threshold to +/-0.5g, which is 7 counts (16 counts/g). Set register $1A LDTH = $07.

TH = $07

TH = $F9

MMA7456L
PULSE DETECTION

There are two interrupt pins available for detection of level and pulse conditions. The pulse detection has several timing windows associated with it. A single pulse and a double pulse can be detected. Also freefall can be detected. The interrupt pins can be assigned to detect the first pulse on one interrupt and the second pulse on the other interrupt. This is explained on , under the Assigning, Clearing & Detecting Interrupts section.

By default all three axes are enabled and the detection range is 8g only. X and/or Y and/or Z can be disabled. There is a choice between doing a detection for Motion detection vs. doing a detection for Freefall.

$18: Control 1 (Read/Write): Disable X, Y or Z for Pulse Detection

This allows the user to define how many axes to use for detection. All axes are enabled by default. To disable write 1

XDA: Disable X

YDA: Disable Y

ZDA: Disable Z.

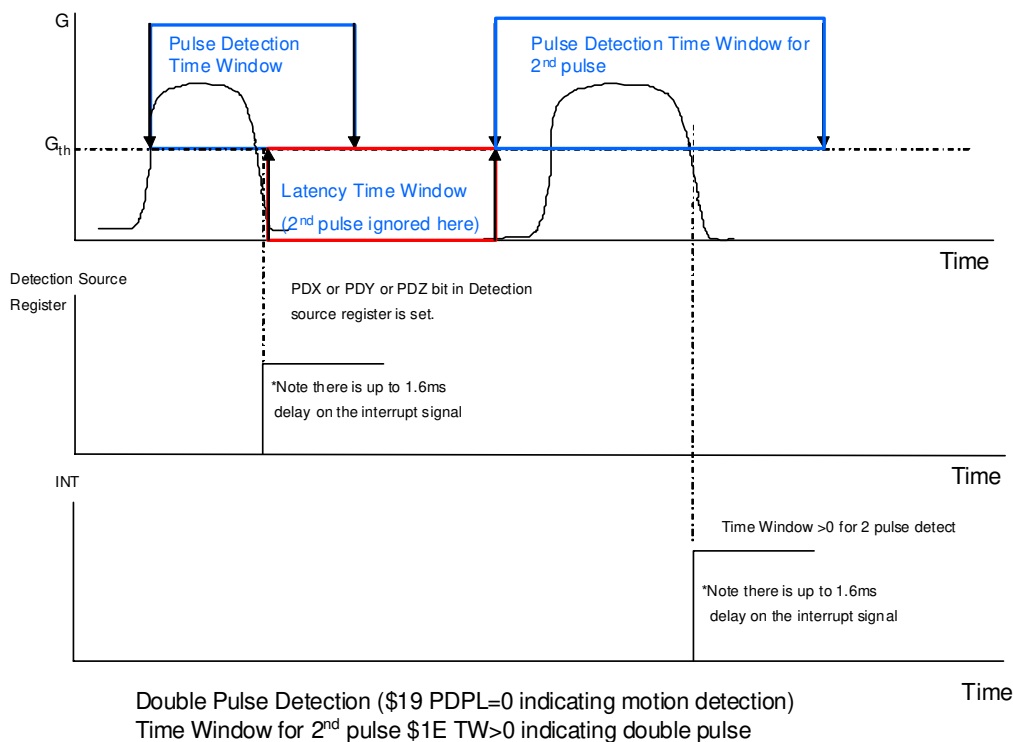

Figure 6. Double Pulse Detection

ASSIGNING, CLEARING & DETECTING INTERRUPTS

Assigning the interrupt pins is done in Register $18. There are 3 combinations for the interrupt pins to be assigned which are outlined below in the table for INTREG[1:0].

$18 Control 1 Register

D7	D6	D5	D4	D3	D2	D1	D0	Reg $18
DFBW	THOPT	ZDA	YDA	XDA	INTREG[1]	INTREG[0]	INTPIN	Function
0	0	0	0	0	0	0	0	Default

Table 7. Configuring the Interrupt settings using Register $18 with INTREG[1:0] bits

INTREG[1:0]	"INT1" Register Bit	"INT2" Register Bit
00	Level detection	Pulse Detection
01	Pulse Detection	Level Detection
10	Single Pulse detection	Single or Double Pulse Detection

00: INT1 Register is detecting Level while INT2 is detecting Pulse.

01: INT1 Register is detecting Pulse while INT2 is detecting Level.

10: INT1 Register is detecting a Single Pulse and INT2 is detecting Single Pulse (if 2nd Time Window = 0) or if there is a latency time window and second time window > 0 then INT2 will detect the double pulse only.

INTPIN: INT1 pin is routed to INT1 bit in Detection Source Register ($0A) and INT2 pin is routed to INT2 bit in Detection Source Register ($0A).

INTPIN: INT2 pin is routed to INT1 bit in Detection Source Register ($0A) and INT1 pin is routed to INT2 bit in Detection Source Register ($0A).

Note: When INTREG[1:0] =10 for the condition to detect single pulse on INT1 and either single or double pulse on INT2, INT1 register bit can no longer be cleared by setting CLR_INT1 bit. It is cleared by setting CLR_INT2 bit. In this case, setting CLR_INT2 clears both INT1 and INT2 register bits and resets the detection operation. Follow the example given for clearing the interrupts.

Clearing the Interrupt Pins: Register $17

$17: Interrupt Latch Reset (Read/Write)

D7	D6	D5	D4	D3	D2	D1	D0	Reg $17
--	--	--	--	--	--	CLR_INT2	CLR_INT1	Function
0	0	0	0	0	0	0	0	Default

CLR_INT1
1: Clear "INT1"
0: Do not clear "INT1"

CLR_INT2
1: Clear "INT2"
0: Do not clear "INT2"

After interrupt has triggered due to a detection, the interrupt pin (INT1 or INT2) need to be cleared by writing a logic 1. Then the interrupt pin should be enabled to trigger the next detection by setting it to a logic 0.

This example is to show how to reset the interrupt flags

void ClearIntLatch(void)

{

IIC_ByteWrite(INTRST, 0x03);

IIC_ByteWrite(INTRST, 0x00);

}

0: Interrupt assigned by INTRG[1:0] bits in Control 1 Register ($18) and is not detected

DIGITAL INTERFACE

The MMA7456L has both an I^2C and SPI digital output available for a communication interface. $\overline{CS}$ pin is used for selecting the mode of communication. When $\overline{CS}$ is low, SPI communication is selected. When $\overline{CS}$ is high, I^2C communication is selected.

Note: It is recommended to disable I^2C during SPI communication to avoid communication errors between devices using a different SPI communication protocol. To disable I^2C, set the I^2CDIS bit in I^2C Device Address register using SPI.

I^2C Slave Interface

I^2C is a synchronous serial communication between a master device and one or more slave devices. The master is typically a microcontroller, which provides the serial clock signal and addresses the slave device(s) on the bus. The MMA7456L communicates only in slave operation where the device address is $1D. Multiple read and write modes are available. The protocol supports slave only operation. It does not support Hs mode, "10-bit addressing", "general call" and: "START byte".

SINGLE BYTE READ

The MMA7456L has an 10-bit ADC that can sample, convert and return sensor data on request. The transmission of an 8-bit command begins on the falling edge of SCL. After the eight clock cycles are used to send the command, note that the data returned is sent with the MSB first once the data is received. Figure 7 shows the timing diagram for the accelerometer 8-bit I^2C read operation. The Master (or MCU) transmits a start condition (ST) to the MMA7456L, slave address ($1D), with the R/W bit set to "0" for a write, and the MMA7456L sends an acknowledgement. Then the Master (or MCU) transmits the 8-bit address of the register to read and the MMA7456L sends an acknowledgement. The Master (or MCU) transmits a repeated start condition (SR) and then addresses the MMA7456L ($1D) with the R/W bit set to "1" for a read from the previously selected register. The Slave then acknowledges and transmits the data from the requested register. The Master does not acknowledge (NAK) it received the transmitted data, but transmits a stop condition to end the data transfer.

MULTIPLE BYTES READ

The MMA7456L automatically increments the received register address commands after a read command is received. Therefore, after following the steps of a single byte read, multiple bytes of data can be read from sequential registers after each MMA7456L acknowledgment (AK) is received until a NACK is received from the Master followed by a stop condition (SP) signalling an end of transmission. See Figure 8.

MMA7456L

SINGLE BYTE WRITE

To start a write command, the Master transmits a start condition (ST) to the MMA7456L, slave address ($1D) with the R/W bit set to "0" for a write, the MMA7456L sends an acknowledgement. Then the Master (MCU) transmits the 8-bit address of the register to write to, and the MMA7456L sends an acknowledgement. Then the Master (or MCU) transmits the 8-bit data to write to the designated register and the MMA7456L sends an acknowledgement that it has received the data. Since this transmission is complete, the Master transmits a stop condition (SP) to the data transfer. The data sent to the MMA7456L is now stored in the appropriate register. See Figure 9.
Figure 7. Single Byte Read - The Master is reading one address from the MMA7456L
Figure 8. Multiple Bytes Read - The Master is reading multiple sequential registers from the MMA7456L
Figure 9. Single Byte Write - The Master (MCU) is writing to a single register of the MMA7456L

MULTIPLE BYTES WRITE

The MMA7456L automatically increments the received register address commands after a write command is received. Therefore, after following the steps of a single byte write, multiple bytes of data can be written to sequential registers after each MMA7456L acknowledgment (ACK) is received. See Figure 10.
Figure 10. Multiple Byte Writes - The Master (MCU) is writing to multiple sequential registers of the MMA7456L

SPI Slave Interface

The MMA7456L also uses serial peripheral interface communication as a digital communication. The SPI communication is primarily used for synchronous serial communication between a master device and one or more slave devices. See Figure 16 for an example of how to configure one master with one MMA745xL device. The MMA7456L is always operated as a slave device. Typically, the master device would be a microcontroller which would drive the clock (SPC) and chip select ($\overline{CS}$) signals.

The SPI interface consists of two control lines and two data lines: $\overline{CS}$, SPC, SDI, and SDO. The $\overline{CS}$, also known as Chip Select, is the slave device enable which is controlled by the SPI master. $\overline{CS}$ is driven low at the start of a transmission. $\overline{CS}$ is then driven high at the end of a transmission. SPC is the Serial Port Clock which is also controlled by the SPI master. SDI and SDO are the Serial Port Data Input and the Serial Port Data Output. The SDI and SDO data lines are driven at the falling edge of the SPC and should be captured at the rising edge of the SPC.

Read and write register commands are completed in 16 clock pulses or in multiples of 8, in the case of a multiple byte read/write.

SPI Read Operation

A SPI read transfer consists of a 1-bit Read/Write signal, a 6-bit address, and 1-bit don't care bit. (1-bit R/W=0 + 6-bits address + 1-bit don't care). The data to read is sent by the SPI interface during the next transfer. See Figure 11 and Figure 12 for the timing diagram for an 8-bit read in 4 wire and 3 wire modes, respectively.

SPI Write Operation

In order to write to one of the 8-bit registers, an 8-bit write command must be sent to the MMA7456L. The write command consists of an MSB (0=read, 1=write) to indicate writing to the MMA7456L register, followed by a 6-bit address and 1 don't care bit.

The command should then be followed the 8-bit data transfer. See Figure 13 for the timing diagram for an 8-bit data write.

Recommended PCB Layout for Interfacing Accelerometer to Microcontroller
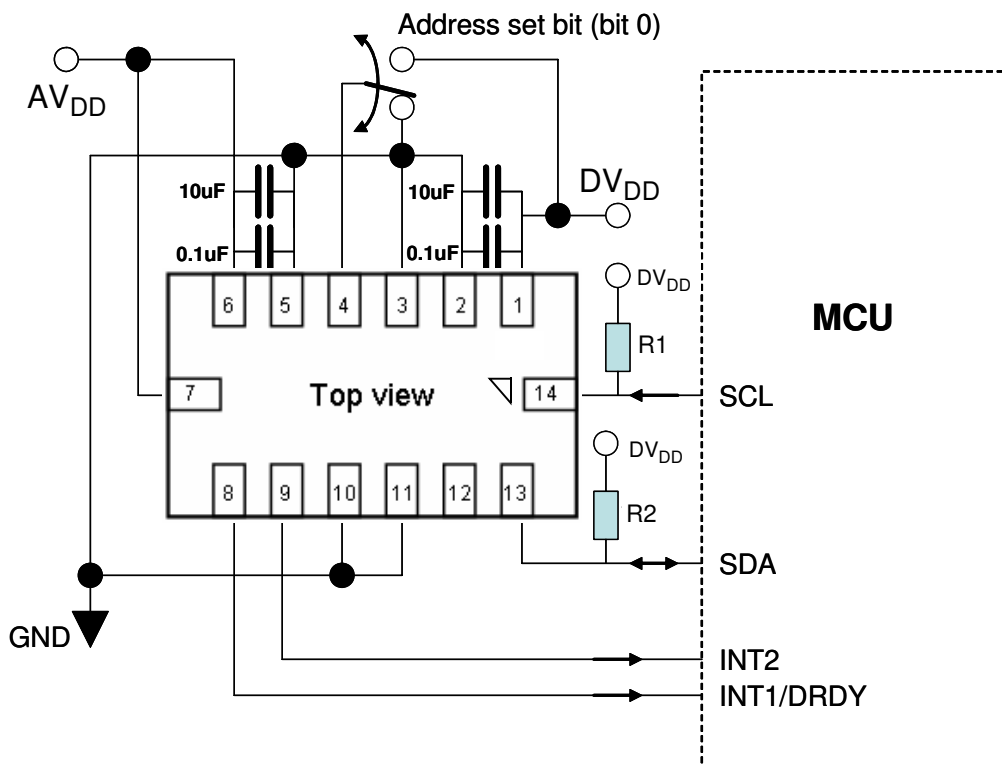

Figure 15. I^2C Connection to MCU

MMA7456L
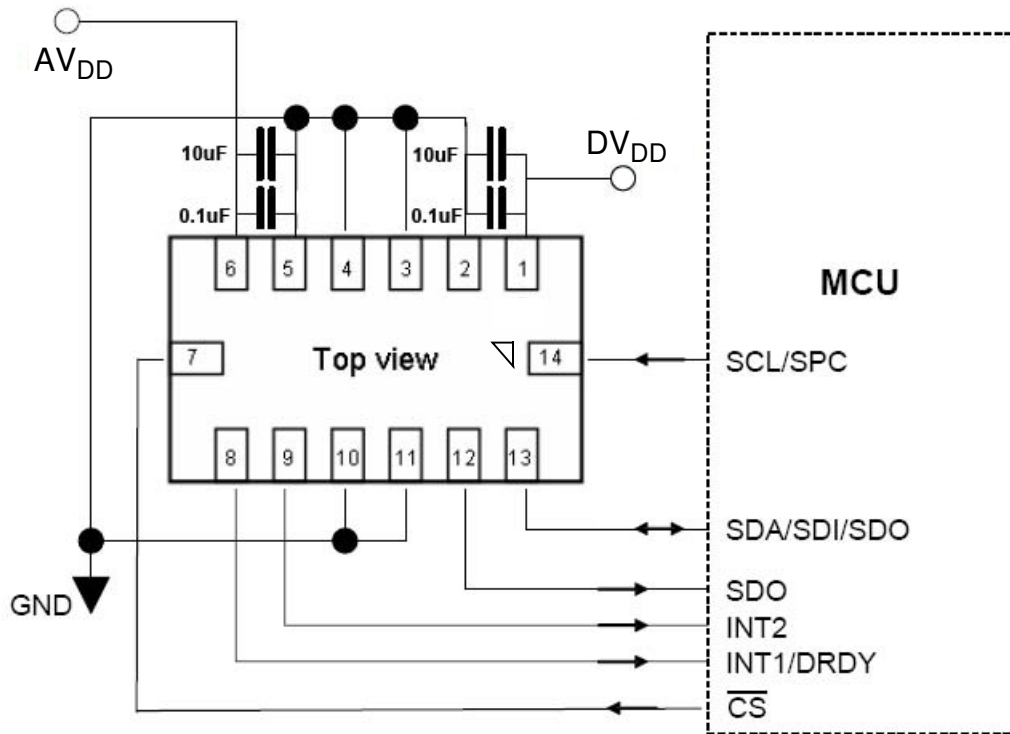

Figure 16. SPI Connection to MCU

NOTES:

1. Use a 0.1 μF and a 10 μF capacitor on AV_{DD} to and DV_{DD} to decouple the power source.

2. Physical coupling distance of the accelerometer to the microcontroller should be minimal.

3. PCB layout of power and ground should not couple power supply noise.

4. Accelerometer and microcontroller should not be a high current path.

5. Any external power supply switching frequency should be selected such that they do not interfere with the internal accelerometer sampling frequency (sampling frequency). This will prevent aliasing errors.

6. Physical distance of the two GND pins (Pin 2 and Pin 5) tied together should be at the shortest distance.

MMA7456L

Bit	ZOFF[7]	ZOFF[6]	ZOFF[5]	ZOFF[4]	ZOFF[3]	ZOFF[2]	ZOFF[1]	ZOFF[0]
Weight*	64 LSB	32 LSB	16 LSB	8 LSB	4 LSB	2 LSB	1 LSB	0.5 LSB

*Bit weight is for 2g 8bit data output. Typical value for reference only. Variation is specified in "Electrical Characteristics" section.

MMA7456L

$15: Offset Drift Z MSB (Read/Write)

D7	D6	D5	D4	D3	D2	D1	D0	Bit
--	--	--	--	--	ZOFF[10]	ZOFF[9]	ZOFF[8]	Function
0	0	0	0	0	0	0	0	Default

Signed byte data (2's complement): User level offset trim value for Z-axis

Bit	ZOFF[10]	ZOFF[9]	ZOFF[8]
Weight*	Polarity	256 LSB	128 LSB

*Bit weight is for 2g 8bit data output. Typical value for reference only. Variation is specified in "Electrical Characteristics" section.

$16: Mode Control Register (Read/Write)

D7	D6	D5	D4	D3	D2	D1	D0	Bit
--	DRPD	SPI3W	STON	GLVL[1]	GLVL[0]	MODE[1]	MODE[0]	Function
0	0	0	0	0	0	0	0	Default

Table 10. Configuring the g-Select for 8-bit output using Register $16 with GLVL[1:0] bits

GLVL [1:0]	g-Range	Sensitivity
00	8g	16 LSB/g
01	2g	64 LSB/g
10	4g	32 LSB/g

GLVL [1:0]

00: 8g is selected for measurement range.

10: 4g is selected for measurement range.

01: 2g is selected for measurement range.

MODE [1:0]

00: Standby Mode

01: Measurement Mode

10: Level Detection Mode

11: Pulse Detection Mode

STON

0: Self-test is not enabled

1: Self-test is enabled

SPI3W

0: SPI is 4 wire mode

1: SPI is 3 wire mode

DRPD

0: Data ready status is output to INT1/DRDY PIN

1: Data ready status is not output to INT1/DRDY PIN

Table 11. Configuring the Mode using Register $16 with MODE[1:0] bits

MODE [1:0]	Function
00	Standby Mode
01	Measurement Mode
10	Level Detection Mode
11	Pulse Detection Mode
