

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MSC8103

Network Digital Signal Processor

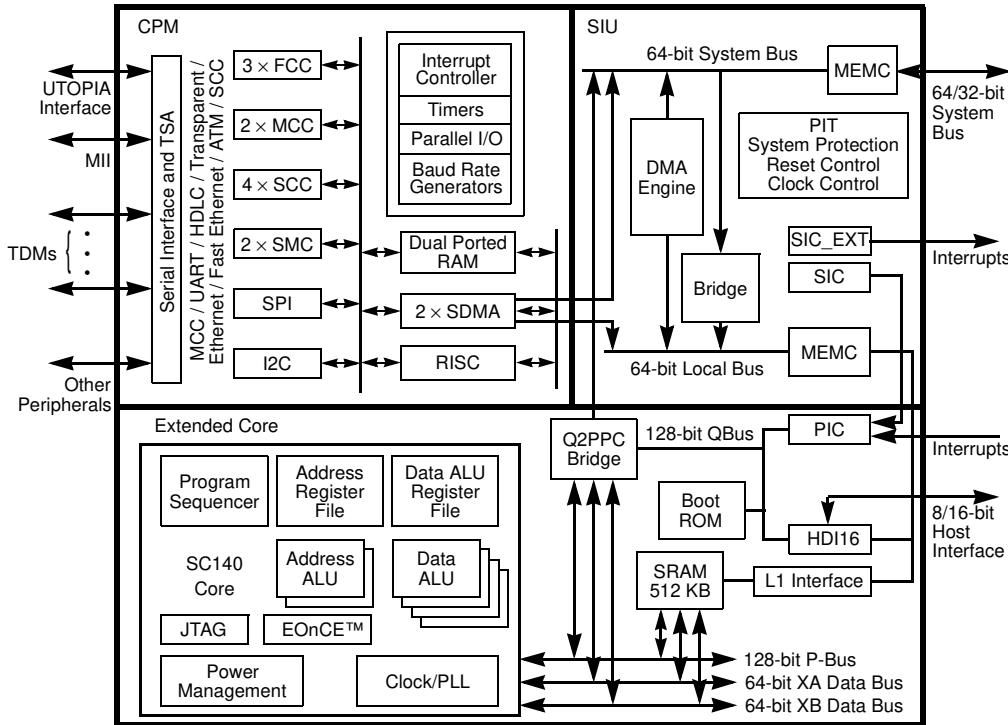

Figure 1. MSC8103 Block Diagram

The Freescale MSC8103 16-bit DSP is a member of the family of DSPs based on the StarCore SC140 DSP core. The MSC8103 is available in two core speed levels: 275 and 300 MHz.

What's New?

Rev. 12 includes the following changes:
 • **Table 2-4** changes V_{IL} reference for signal low input current to 0.8 V.

The Freescale MSC8103 DSP is a very versatile device that integrates the high-performance SC140 four-ALU (arithmetic logic unit) DSP core along with 512 KB of internal memory, a communications processor module (CPM), a 64-bit bus, a very flexible system integration unit (SIU), and a 16-channel DMA engine on a single device. With its four-ALU core, the MSC8103 can execute up to four multiply-accumulate (MAC) operations in a single clock cycle. The MSC8103 CPM is a 32-bit RISC-based communications protocol engine that can network to time-division multiplexed (TDM) highways, Ethernet, and asynchronous transfer mode (ATM) backbones. The MSC8103 60x-compatible bus interface facilitates its connection to multi-master system architectures. The very large internal memory, 512 KB, reduces the need for external program and data memories. The MSC8103 offers 1200 DSP MMACS performance using an internal 300 MHz clock with a 1.6 V core and independent 3.3 V input/output (I/O).

Table of Contents

Data Sheet Conventions

pin and pin-out	Although the device package does not have pins, the term pins and pin-out are used for convenience and indicate specific signal locations within the ball-grid array.			
<u>OVERBAR</u>	Used to indicate a signal that is active when pulled low (For example, the $\overline{\text{RESET}}$ pin is active when low.)			
“asserted”	Means that a high true (active high) signal is high or that a low true (active low) signal is low			
“deasserted”	Means that a high true (active high) signal is low or that a low true (active low) signal is high			
Examples:	Signal/Symbol	Logic State	Signal State	Voltage
	$\overline{\text{PIN}}$	True	Asserted	$V_{\text{IL}}/V_{\text{OL}}$
	$\overline{\text{PIN}}$	False	Deasserted	$V_{\text{IH}}/V_{\text{OH}}$
	PIN	True	Asserted	$V_{\text{IH}}/V_{\text{OH}}$
	PIN	False	Deasserted	$V_{\text{IL}}/V_{\text{OL}}$

Note: Values for V_{IL} , V_{OL} , V_{IH} , and V_{OH} are defined by individual product specifications.

MSC8103 Features

- SC140 core
 - Architecture optimized for efficient C/C++ code compilation
 - Four 16-bit ALUs and two 32-bit AGUs
 - 1200 DSP MMACS running at 300 MHz
 - Very low power dissipation
 - Variable-length execution set (VLES) execution model
 - JTAG/Enhanced OnCE debug port
- Communications processor module (CPM)
 - Programmable protocol machine using a 32-bit RISC engine
 - 155 Mbps ATM interface (including AAL 0/1/2/5)
 - 10/100 Mbit Ethernet interface
 - Up to four E1/T1 interfaces or one E3/T3 interface and one E1/T1 interface
 - HDLC support up to T3 rates, or 256 channels
- 64- or 32-bit wide bus interface
 - Support for bursts for high efficiency
 - Glueless interface to 60x-compatible bus systems
 - Multi-master support
- Programmable memory controller
 - Control for up to eight banks of external memory
 - User-programmable machines (UPM) allowing glueless interface to various memory types (SRAM, DRAM, EPROM, and Flash memory) and other user-definable peripherals
 - Dedicated pipelined SDRAM memory interface
- Large internal SRAM
 - 256K 16-bit words (512 KB)
 - Unified program and data space configurable by the application
 - Word and byte addressable
- DMA controller
 - 16 DMA channels, FIFO based, with burst capabilities
 - Sophisticated addressing capabilities
- Small foot print package
 - 17 mm × 17 mm lidded FC-PBGA package with lead-bearing or lead-free spheres
- Very low power consumption
 - Separate power supply for internal logic (1.6 V) and for I/O (3.3 V)
- Enhanced 16-bit parallel host interface (HDI16)
 - Supports a variety of microcontroller, microprocessor, and DSP bus interfaces
- Phase-lock loops (PLLs)
 - System PLL
 - CPM DPLLs (SCC and SCM)
- Process technology
 - 0.13 micron copper interconnect process technology

Target Applications

The MSC8103 targets applications requiring very high performance, very large amounts of internal memory, and such networking capabilities as:

- Third-generation wideband wireless infrastructure systems
- Packet Telephony systems
- Multi-channel modem banks
- Multi-channel xDSL

Product Documentation

The documents listed in **Table 1** are required for a complete description of the MSC8103 and are necessary to design properly with the part. Documentation is available from the following sources (see back cover for details):

- A local Freescale distributor
- A Freescale Semiconductor sales office
- A Freescale Semiconductor Literature Distribution Center
- The world wide web (WWW)

Table 1. MSC8103 Documentation

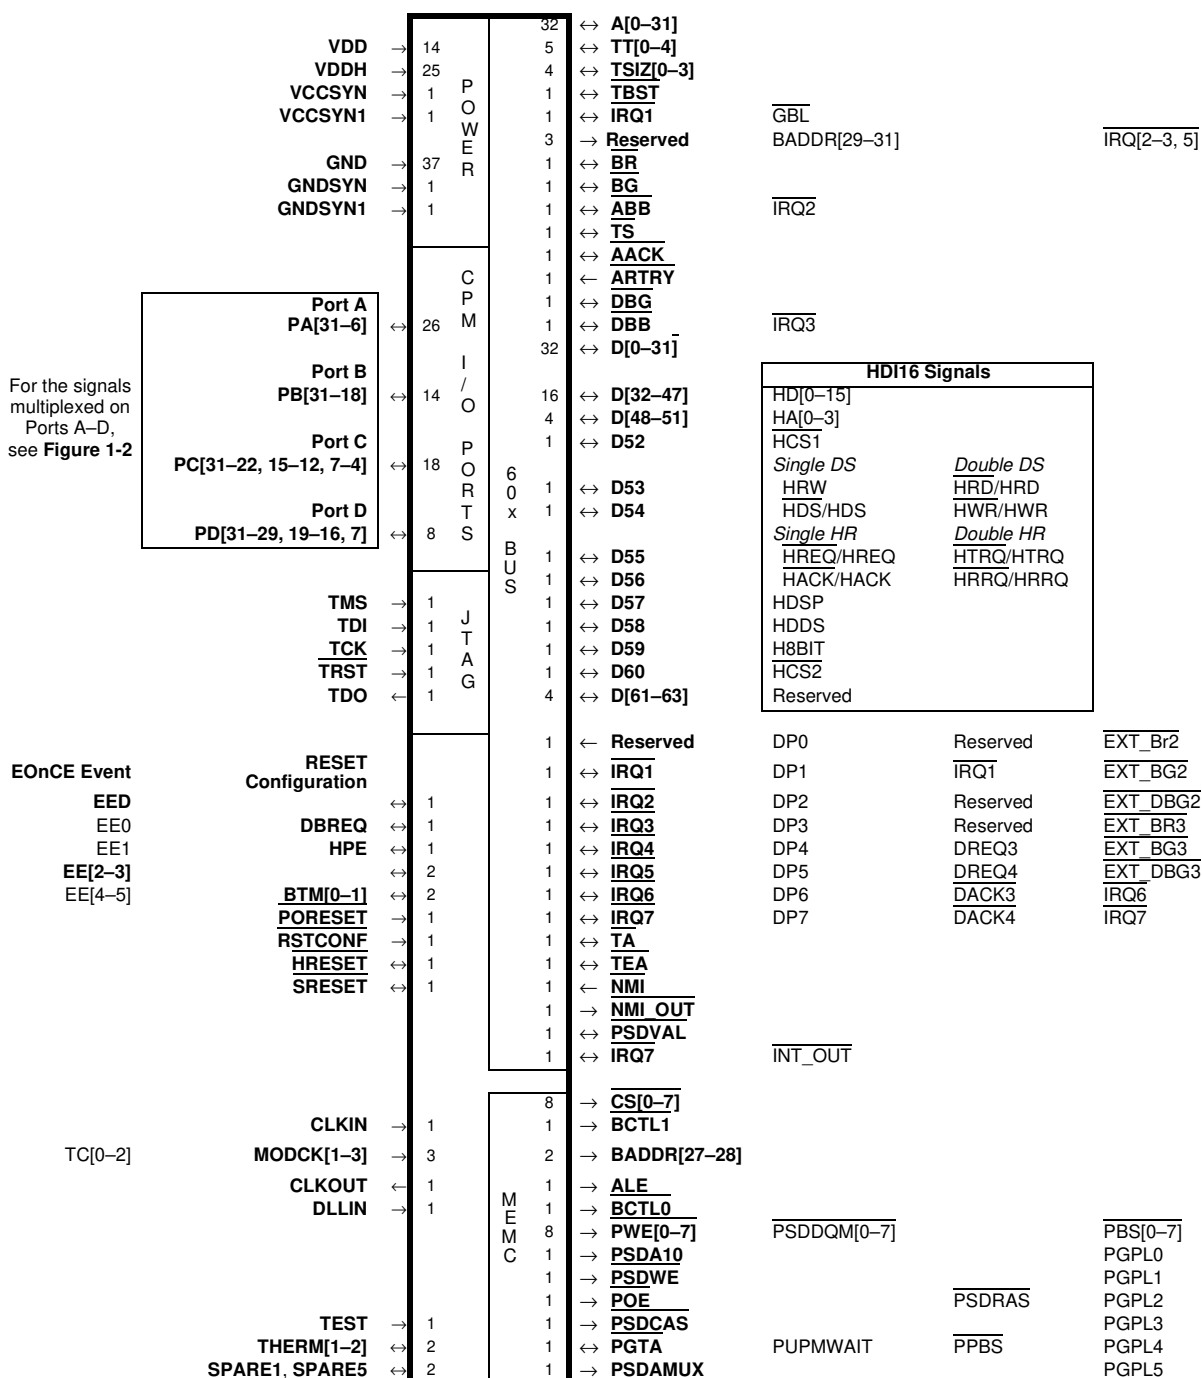

Name	Description	Order Number
<i>MSC8103 Technical Data</i>	MSC8103 features list and physical, electrical, timing, and package specifications	MSC8103/D
<i>MSC8101 User's Guide</i>	Detailed functional description of the MSC8101 memory configuration, operation, and register programming. All details apply to the MSC8103.	MSC8101UG/D
<i>MSC8103 Reference Manual</i>	Detailed description of the MSC8103 processor core and instruction set	MSC8103RM/D
<i>SC140 DSP Core Reference Manual</i>	Detailed description of the SC140 family processor core and instruction set	MNSC140CORE/D
<i>Application Notes</i>	Documents describing specific applications or optimized device operation including code examples	See the MSC8103 product website

Signals/Connections

The MSC8103 external signals are organized into functional groups, as shown in **Table 1-1**, **Figure 1-1**, and **Figure 1-2**. **Table 1-1** lists the functional groups, states the number of signal connections in each group, and references the table that gives details on multiplexed signals within each group. **Figure 1-1** shows MSC8103 external signals organized by function. **Figure 1-2** indicates how the parallel input/output (I/O) ports signals are multiplexed. Because the parallel I/O design supported by the MSC8103 communications processor module (CPM) is a subset of the parallel I/O signals supported by the MPC8260 device, port pins are not numbered sequentially.

Table 1-1. MSC8103 Functional Signal Groupings

Functional Group		Number of Signal Connections	Detailed Description

1.1 Power Signals

Table 1-2. Power and Ground Signal Inputs

Power Name	Description
V _{DD}	Internal Logic Power V _{DD} dedicated for use with the device core. The voltage should be well-regulated and the input should be provided with an extremely low impedance path to the V _{DD} power rail.
V _{DDH}	Input/Output Power This source supplies power for the I/O buffers. The user must provide adequate external decoupling capacitors.
V _{CCSYN}	System PLL Power V _{CC} dedicated for use with the system Phase Lock Loop (PLL). The voltage should be well-regulated and the input should be provided with an extremely low impedance path to the V _{CC} power rail.
V _{CCSYN1}	SC140 PLL Power V _{CC} dedicated for use with the SC140 core PLL. The voltage should be well-regulated and the input should be provided with an extremely low impedance path to the V _{CC} power rail.
GND	System Ground An isolated ground for the internal processing logic. This connection must be tied externally to all chip ground connections, except GND _{SYN} and GND _{SYN1} . The user must provide adequate external decoupling capacitors.
GND _{SYN}	System PLL Ground Ground dedicated for system PLL use. The connection should be provided with an extremely low-impedance path to ground.
GND _{SYN1}	SC140 PLL Ground 1 Ground dedicated for SC140 core PLL use. The connection should be provided with an extremely low-impedance path to ground.

1.2 Clock Signals

Table 1-3. Clock Signals

Signal Name	Type	Signal Description
CLKIN	Input	Clock In Primary clock input to the MSC8103 PLL.
MODCK1	Input	Clock Mode Input 1 Defines the operating mode of internal clock circuits.
TC0	Output	Transfer Code 0 Supplies information that can be useful for debugging bus transactions initiated by the MSC8103.
BNKSEL0	Output	Bank Select 0 Selects the SDRAM bank when the MSC8103 is in 60x-compatible bus mode.
MODCK2	Input	Clock Mode Input 2 Defines the operating mode of internal clock circuits.
TC1	Output	Transfer Code 1 Supplies information that can be useful for debugging bus transactions initiated by the MSC8103.
BNKSEL1	Output	Bank Select 1 Selects the SDRAM bank when the MSC8103 is in 60x-compatible bus mode.
MODCK3	Input	Clock Mode Input 3 Defines the operating mode of internal clock circuits.
TC2	Output	Transfer Code 2 Supplies information that can be useful for debugging bus transactions initiated by the MSC8103.
BNKSEL2	Output	Bank Select 2 Selects the SDRAM bank when the MSC8103 is in 60x-compatible bus mode.

Table 1-3. Clock Signals (Continued)

Signal Name	Type	Signal Description
CLKOUT	Output	Clock Out The system bus clock.
DLLIN	Input	DLLIN Synchronizes with an external device. Note: When the DLL is disabled, connect this signal to GND.

1.3 Reset, Configuration, and EOnCE Event Signals

Table 1-4. Reset, Configuration, and EOnCE Event Signals

Signal Name	Type	Signal Description
DBREQ	Input	Debug Request Determines whether to go into SC140 Debug mode when $\overline{\text{PORESET}}$ is deasserted.
EE0 ¹		Enhanced OnCE (EOnCE) Event 0 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE0 as an input (default) or an output.
	Input	Debug request, enable Address Event Detection Channel 0, or generate an EOnCE event.
	Output	Detection by Address Event Detection Channel 0. Used to trigger external debugging equipment.
HPE	Input	Host Port Enable When this pin is asserted during $\overline{\text{PORESET}}$, the Host port is enabled, the system data bus is 32 bits wide, and the Host <i>must</i> program the reset configuration word.
EE1 ¹		EOnCE Event 1 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE1 as an input (default) or an output.
	Input	Enable Address Event Detection Channel 1 or generate an EOnCE event.
	Output	Debug Acknowledge or detection by Address Event Detection Channel 1. Used to trigger external debugging equipment.
EE2 ¹		EOnCE Event 2 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE2 as an input (default) or an output.
	Input	Enable Address Event Detection Channel 2 or generate an EOnCE event or enable the Event Counter.
	Output	Detection by Address Event Detection Channel 2. Used to trigger external debugging equipment.
EE3 ¹		EOnCE Event 3 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE3 as an input (default) or an output. See the emulation and debug chapter in the <i>SC140 DSP Core Reference Manual</i> for details on the ERVC Register.
	Input	Enable Address Event Detection Channel 3 or generate one of the EOnCE events.
	Output	The DSP has read the EOnCE Receive Register (ERCV). Triggers external debugging equipment.

Table 1-4. Reset, Configuration, and EOnCE Event Signals (Continued)

Signal Name	Type	Signal Description
BTM[0–1]	Input	Boot Mode 0–1 Determines the MSC8103 boot mode when $\overline{\text{PORESET}}$ is deasserted. See the emulation and debug chapter in the <i>SC140 DSP Core Reference Manual</i> for details on how to set these pins.
EE4 ¹	Input	EOnCE Event 4 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE4 as an input (default) or an output. See the emulation and debug chapter in the <i>SC140 DSP Core Reference Manual</i> for details on the ETRSMT Register.
EE5 ¹	Input	Enable Address Event Detection Channel 4 or generate an EOnCE event.
	Output	The DSP wrote the EOnCE Transmit Register (ETRSMT). Triggers external debugging equipment.
	Input	EOnCE Event 5 After $\overline{\text{PORESET}}$ is deasserted, you can configure EE5 as an input (default) or an output.
EED ¹	Input	Enable Address Event Detection Channel 5.
	Output	Detection by Address Event Detection Channel 5. Triggers external debugging equipment.
	Input	Enhanced OnCE (EOnCE) Event Detection After $\overline{\text{PORESET}}$ is deasserted, you can configure EED as an input (default) or output:
	Input	Enable the Data Event Detection Channel.
	Output	Detection by the Data Event Detection Channel. Triggers external debugging equipment.
$\overline{\text{PORESET}}$	Input	Power-On Reset When asserted, this line causes the MSC8103 to enter power-on reset state.
$\overline{\text{RSTCONF}}$	Input	Reset Configuration Used during reset configuration sequence of the chip. A detailed explanation of its function is provided in the “Power-On Reset Flow” and “Hardware Reset Configuration” sections of the <i>MSC8103 Reference Manual</i> .
$\overline{\text{HRESET}}$	Input	Hard Reset When asserted, this open-drain line causes the MSC8103 to enter the hard reset state.
$\overline{\text{SRESET}}$	Input	Soft Reset When asserted, this open-drain line causes the MSC8103 to enter the soft reset state.
Note: See the emulation and debug chapter in the <i>SC140 DSP Core Reference Manual</i> for details on how to configure these pins.		

1.4 System Bus, HDI16, and Interrupt Signals

The system bus, HDI16, and interrupt signals are grouped together because they use a common set of signal lines. Individual assignment of a signal to a specific signal line is configured through registers in the System Interface Unit (SIU) and the Host Interface (HDI16). 1-5 describes the signals in this group.

Note: To boot from the host interface, the HDI16 must be enabled by pulling up the HPE signal line during $\overline{\text{PORESET}}$. The configuration word must then be loaded from the host. The configuration word must set the Internal Space Port Size bit in the Bus Control Register (BCR[ISPS]) to change the system data bus width from 64 bits to 32 bits and reassign the upper 32 bits to their HDI16 functions. Never set the Host Port Enable (HEN) bit in the Host Port Control Register (HPCR) to enable the HDI16, unless the bus size is first changed from 64 bits to 32 bits. Otherwise, unpredictable operation may occur.

Although there are eight interrupt request ($\overline{\text{IRQ}}$) connections to the core processor, there are multiple external lines that can connect to these internal signal lines. After reset, the default configuration includes two $\overline{\text{IRQ1}}$ and two $\overline{\text{IRQ7}}$ input lines. The designer must select one line for each required interrupt and reconfigure the other external signal line or lines for alternate functions.

Table 1-5. System Bus, HDI16, and Interrupt Signals

Signal	Data Flow	Description
A[0–31]	Input/Output	Address Bus When the MSC8103 is in external master bus mode, these pins function as the address bus. The MSC8103 drives the address of its internal bus masters and responds to addresses generated by external bus masters. When the MSC8103 is in Internal Master Bus mode, these pins are used as address lines connected to memory devices and are controlled by the MSC8103 memory controller.
TT[0–4]	Input/Output	Bus Transfer Type The bus master drives these pins during the address tenure to specify the type of transaction.
TSIZ[0–3]	Input/Output	Transfer Size The bus master drives these pins with a value indicating the number of bytes transferred in the current transaction.
$\overline{\text{TBST}}$	Input/Output	Bus Transfer Burst The bus master asserts this pin to indicate that the current transaction is a burst transaction (transfers four quad words).
$\overline{\text{IRQ1}}$	Input	Interrupt Request 1¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
$\overline{\text{GBL}}$	Input/Output	Global¹ When a master within the chip initiates a bus transaction, it drives this pin. When an external master initiates a bus transaction, it should drive this pin. Assertion of this pin indicates that the transfer is global and it should be snooped by caches in the system.
Reserved	Output	The primary configuration is reserved.
BADDR29	Output	Burst Address 29¹ One of five outputs of the memory controller. These pins connect directly to memory devices controlled by the MSC8103 memory controller.
$\overline{\text{IRQ2}}$	Input	Interrupt Request 2¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
Reserved	Output	The primary configuration is reserved.
BADDR30	Output	Burst Address 30¹ One of five outputs of the memory controller. These pins connect directly to memory devices controlled by the MSC8103 memory controller.
$\overline{\text{IRQ3}}$	Input	Interrupt Request 3¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
Reserved	Output	The primary configuration is reserved.
BADDR31	Output	Burst Address 31¹ One of five outputs of the memory controller. These pins connect directly to memory devices controlled by the MSC8103 memory controller.
$\overline{\text{IRQ5}}$	Input	Interrupt Request 5¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
$\overline{\text{BR}}$	Input/Output Output	Bus Request² An output when an external arbiter is used. The MSC8103 asserts this pin to request ownership of the bus.
	Input	An input when an internal arbiter is used. An external master should assert this pin to request bus ownership from the internal arbiter.
$\overline{\text{BG}}$	Input/Output Output	Bus Grant² An output when an internal arbiter is used. The MSC8103 asserts this pin to grant bus ownership to an external bus master.
	Input	An input when an external arbiter is used. The external arbiter should assert this pin to grant bus ownership to the MSC8103.
$\overline{\text{ABB}}$	Input/Output Output	Address Bus Busy¹ The MSC8103 asserts this pin for the duration of the address bus tenure. Following an address acknowledge (AACK) signal, which terminates the address bus tenure, the MSC8103 deasserts ABB for a fraction of a bus cycle and then stops driving this pin.
	Input	The MSC8103 does not assume bus ownership while this pin is asserted by an external bus master.
$\overline{\text{IRQ2}}$	Input	Interrupt Request 2¹ One of the eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
$\overline{\text{TS}}$	Input/Output	Bus Transfer Start Signals the beginning of a new address bus tenure. The MSC8103 asserts this signal when one of its internal bus masters (SC140 core or DMA controller) begins an address tenure. When the MSC8103 senses this pin being asserted by an external bus master, it responds to the address bus tenure as required (snoop if enabled, access internal MSC8103 resources, memory controller support).
$\overline{\text{AACK}}$	Input/Output	Address Acknowledge A bus slave asserts this signal to indicate that it identified the address tenure. Assertion of this signal terminates the address tenure.
$\overline{\text{ARTRY}}$	Input	Address Retry Assertion of this signal indicates that the bus transaction should be retried by the bus master. The MSC8103 asserts this signal to enforce data coherency with its internal cache and to prevent deadlock situations.
$\overline{\text{DBG}}$	Input/Output Output	Data Bus Grant² An output when an internal arbiter is used. The MSC8103 asserts this pin as an output to grant data bus ownership to an external bus master.
	Input	An input when an external arbiter is used. The external arbiter should assert this pin as an input to grant data bus ownership to the MSC8103.
$\overline{\text{DBB}}$	Input/Output Output	Data Bus Busy¹ The MSC8103 asserts this pin as an output for the duration of the data bus tenure. Following a $\overline{\text{TA}}$, which terminates the data bus tenure, the MSC8103 deasserts DBB for a fraction of a bus cycle and then stops driving this pin.
	Input	The MSC8103 does not assume data bus ownership while $\overline{\text{DBB}}$ is asserted by an external bus master.
$\overline{\text{IRQ3}}$	Input	Interrupt Request 3¹ One of the eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
D[0–31]	Input/Output	Data Bus Most Significant Word In write transactions the bus master drives the valid data on this bus. In read transactions the slave drives the valid data on this bus. In Host Port Disabled mode, these 32 bits are part of the 64-bit data bus. In Host Port Enabled mode, these bits are used as the bus in 32-bit mode.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
D[32–47]	Input/Output	Data Bus Bits 32–47 In write transactions the bus master drives the valid data on this bus. In read transactions the slave drives the valid data on this bus.
HD[0–15]	Input/Output	Host Data² When the HDI16 interface is enabled, these signals are lines 0-15 of the bidirectional tri-state data bus.
D[48–51]	Input/Output	Data Bus Bits 48–51 In write transactions the bus master drives the valid data on these pins. In read transactions the slave drives the valid data on these pins.
HA[0–3]	Input	Host Address Line 0–3³ When the HDI16 interface bus is enabled, these lines address internal host registers.
D52	Input/Output	Data Bus Bit 52 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
$\overline{\text{HCS1}}$	Input	Host Chip Select³ When the HDI16 interface is enabled, this is one of the two chip-select pins. The HDI16 chip select is a logical OR of $\overline{\text{HCS1}}$ and $\overline{\text{HCS2}}$.
D53	Input/Output	Data Bus Bit 53 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
HRW	Input	Host Read Write Select³ When the HDI16 interface is enabled in Single Strobe mode, this is the read/write input (HRW).
$\overline{\text{HRD}}/\text{HRD}$	Input	Host Read Strobe³ When the HDI16 is programmed to interface with a double data strobe host bus, this pin is the read data strobe Schmitt trigger input ($\overline{\text{HRD}}/\text{HRD}$). The polarity of the data strobe is programmable.
D54	Input/Output	Data Bus Bit 54 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
$\overline{\text{HDS}}/\text{HDS}$	Input	Host Data Strobe³ When the HDI16 is programmed to interface with a single data strobe host bus, this pin is the data strobe Schmitt trigger input ($\overline{\text{HDS}}/\text{HDS}$). The polarity of the data strobe is programmable.
$\overline{\text{HWR}}/\text{HWR}$	Input	Host Write Data Strobe³ When the HDI16 is programmed to interface with a double data strobe host bus, this pin is the write data strobe Schmitt trigger input ($\overline{\text{HWR}}/\text{HWR}$). The polarity of the data strobe is programmable.
D55	Input/Output	Data Bus Bit 55 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
$\overline{\text{HREQ}}/\text{HREQ}$	Output	Host Request³ When the HDI16 is programmed to interface with a single host request host bus, this pin is the host request output ($\overline{\text{HREQ}}/\text{HREQ}$). The polarity of the host request is programmable. The host request may be programmed as a driven or open-drain output.
$\overline{\text{HTRQ}}/\text{HTRQ}$	Output	Transmit Host Request³ When the HDI16 is programmed to interface with a double host request host bus, this pin is the transmit host request output ($\overline{\text{HTRQ}}/\text{HTRQ}$). The signal can be programmed as driven or open drain. The polarity of the host request is programmable.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
D56	Input/Output	Data Bus Bit 56 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
$\overline{\text{HACK}}$ /HACK	Output	Host Acknowledge³ When the HDI16 is programmed to interface with a single host request host bus, this pin is the host acknowledge Schmitt trigger input (HACK). The polarity of the host acknowledge is programmable.
$\overline{\text{HRRQ}}$ /HRRQ	Output	Receive Host Request³ When the HDI16 is programmed to interface with a double host request host bus, this pin is the receive host request output ($\overline{\text{HRRQ}}$ /HRRQ). The signal can be programmed as driven or open drain. The polarity of the host request is programmable.
D57	Input/Output	Data Bus Bit 57 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
HDSP	Input	Host Data Strobe Polarity³ When the HDI16 interface is enabled, this pin is the host data strobe polarity (HDSP).
D58	Input/Output	Data Bus Bit 58 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
HDDS	Input	Host Dual Data Strobe³ When the HDI16 interface is enabled, this pin is the host dual data strobe (HDDS).
D59	Input/Output	Data Bus Bit 59 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
H8BIT	Input	H8BIT³ When the HDI16 interface is enabled, this bit determines if the interface is in 8-bit or 16-bit mode.
D60	Input/Output	Data Bus Bit 60 In write transactions the bus master drives the valid data on this pin. In read transactions the slave drives the valid data on this pin.
$\overline{\text{HCS2}}$	Input	Host Chip Select³ When the HDI16 interface is enabled, this is one of the two chip-select pins. The HDI16 chip select is a logical OR of HCS1 and HCS2.
D[61–63]	Input/Output	Data Bus Bits 61–63 Used only in 60x-mode-only mode. In write transactions the bus master drives the valid data on this bus. In read transactions the slave drives the valid data on this bus.
Reserved		These dedicated signals are reserved when the HDI16 is enabled. ³
Reserved	Input	The primary configuration is reserved.
DP0	Input/Output	Data Parity 0¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity zero pin should give odd parity (odd number of ones) on the group of signals that includes data parity 0 and D[0–7].
$\overline{\text{EXT_BR2}}$	Input	External Bus Request 2^{1,2} An external master asserts this pin to request bus ownership from the internal arbiter.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
$\overline{\text{IRQ1}}$	Input	Interrupt Request 1¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP1	Input/Output	Data Parity 1¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity one pin should give odd parity (odd number of ones) on the group of signals that includes data parity 1 and D[8–15].
$\overline{\text{EXT_BG2}}$	Output	External Bus Grant 2^{1,2} The MSC8103 asserts this pin to grant bus ownership to an external bus master.
$\overline{\text{IRQ2}}$	Input	Interrupt Request 2¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP2	Input/Output	Data Parity 2¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity two pin should give odd parity (odd number of ones) on the group of signals that includes data parity 2 and D[16–23].
$\overline{\text{EXT_DBG2}}$	Output	External Data Bus Grant 2^{1,2} The MSC8103 asserts this pin to grant data bus ownership to an external bus master.
$\overline{\text{IRQ3}}$	Input	Interrupt Request 3¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP3	Input/Output	Data Parity 3¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity three pin should give odd parity (odd number of ones) on the group of signals that includes data parity 3 and D[24–31].
$\overline{\text{EXT_BR3}}$	Input	External Bus Request 3^{1,2} An external master asserts this pin to request bus ownership from the internal arbiter.
$\overline{\text{IRQ4}}$	Input	Interrupt Request 4¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP4	Input/Output	Data Parity 4¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity four pin should give odd parity (odd number of ones) on the group of signals that includes data parity 4 and D[32–39].
DREQ3	Input	DMA Request 3¹ An external peripheral uses this pin to request DMA service.
$\overline{\text{EXT_BG3}}$	Output	External Bus Grant 3^{1,2} The MSC8103 asserts this pin to grant bus ownership to an external bus master.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
$\overline{\text{IRQ5}}$	Input	Interrupt Request 5¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP5	Input/Output	Data Parity 5¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity five pin should give odd parity (odd number of ones) on the group of signals that includes data parity 5 and D[40–47].
DREQ4	Input	DMA Request 4¹ An external peripheral uses this pin to request DMA service.
$\overline{\text{EXT_DBG3}}$	Output	External Data Bus Grant 3^{1,2} The MSC8103 asserts this pin to grant data bus ownership to an external bus master.
$\overline{\text{IRQ6}}$	Input	Interrupt Request 6¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP6	Input/Output	Data Parity 6¹ The agent that drives the data bus also drives the data parity signals. The value driven on the data parity six pin should give odd parity (odd number of ones) on the group of signals that includes data parity 6 and D[48–55].
$\overline{\text{DACK3}}$	Output	DMA Acknowledge 3¹ The DMA controller drives this output to acknowledge the DMA transaction on the bus.
$\overline{\text{IRQ7}}$	Input	Interrupt Request 7¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
DP7	Input/Output	Data Parity 7¹ The master or slave that drives the data bus also drives the data parity signals. The value driven on the data parity seven pin should give odd parity (odd number of ones) on the group of signals that includes data parity 7 and D[56–63].
$\overline{\text{DACK4}}$	Output	DMA Acknowledge¹ The DMA controller drives this output to acknowledge the DMA transaction on the bus.
$\overline{\text{TA}}$	Input/Output	Transfer Acknowledge Indicates that a data beat is valid on the data bus. For single beat transfers, assertion of $\overline{\text{TA}}$ indicates the termination of the transfer. For burst transfers, $\overline{\text{TA}}$ is asserted four times to indicate the transfer of four data beats with the last assertion indicating the termination of the burst transfer.
$\overline{\text{TEA}}$	Input/Output	Transfer Error Acknowledge Indicates a bus error. masters within the MSC8103 monitor the state of this pin. The MSC8103 internal bus monitor can assert this pin if it identifies a bus transfer that is hung.
$\overline{\text{NMI}}$	Input	Non-Maskable Interrupt When an external device asserts this line, the MSC8103 $\overline{\text{NMI}}$ input is asserted.
$\overline{\text{NMI_OUT}}$	Output	Non-Maskable Interrupt Driven from the MSC8103 internal interrupt controller. Assertion of this output indicates that a non-maskable interrupt, pending in the MSC8103 internal interrupt controller, is waiting to be handled by an external host.
$\overline{\text{PSDVAL}}$	Input/Output	Data Valid Indicates that a data beat is valid on the data bus. The difference between the $\overline{\text{TA}}$ pin and $\overline{\text{PSDVAL}}$ is that the $\overline{\text{TA}}$ pin is asserted to indicate data transfer terminations while the $\overline{\text{PSDVAL}}$ signal is asserted with each data beat movement. Thus, when $\overline{\text{TA}}$ is asserted, $\overline{\text{PSDVAL}}$ is asserted, but when $\overline{\text{PSDVAL}}$ is asserted, $\overline{\text{TA}}$ is not necessarily asserted. For example when the SDMA initiates a double word (2x64 bits) transfer to a memory device that has a 32-bit port size, $\overline{\text{PSDVAL}}$ is asserted three times without $\overline{\text{TA}}$, and finally both pins are asserted to terminate the transfer.

Table 1-5. System Bus, HDI16, and Interrupt Signals (Continued)

Signal	Data Flow	Description
$\overline{\text{IRQ7}}$	Input	Interrupt Request 7¹ One of eight external lines that can request a service routine, via the internal interrupt controller, from the SC140 core.
$\overline{\text{INT_OUT}}$	Output	Interrupt Output¹ Driven from the MSC8103 internal interrupt controller. Assertion of this output indicates that an unmasked interrupt is pending in the MSC8103 internal interrupt controller.
Notes: <ol style="list-style-type: none"> See the SIU chapter in the <i>MSC8103 Reference Manual</i> for details on how to configure these pins. When used as the bus control arbiter for the system bus, the MSC8103 can support up to three external bus masters. Each master uses its own set of Bus Request, Bus Grant, and Data Bus Grant signals ($\overline{\text{BR/BG/DBG}}$, $\overline{\text{EXT_BR2/EXT_BG2/EXT_DBG2}}$, and $\overline{\text{EXT_BR3/EXT_BG3/EXT_DBG3}}$). Each of these signal sets must be configured to indicate whether the external master is or is not a MSC8103 master device. See the Bus Configuration Register (BCR) description in the SIU chapter in the <i>MSC8103 Reference Manual</i> for details on how to configure these pins. The second and third set of pins is defined by EXT_xxx to indicate that they can only be used with external master devices. The first set of pins ($\overline{\text{BR/BG/DBG}}$) have a dual function. When the MSC8103 is not the bus arbiter, these signals ($\overline{\text{BR/BG/DBG}}$) are used by the MSC8103 to obtain master control of the bus. See the host interface (HDI16) chapter in the <i>MSC8103 Reference Manual</i> for details on how to configure these pins. 		

1.5 Memory Controller Signals

Refer to the memory controller chapter in the *MSC8103 Reference Manual (MSC8103RM/D)* for detailed information about configuring these signals.

Table 1-6. Memory Controller Signals

Signal	Data Flow	Description
$\overline{\text{CS}}[0-7]$	Output	Chip Select Enable specific memory devices or peripherals connected to MSC8103 buses.
$\overline{\text{BCTL1}}$	Output	Buffer Control 1 Controls buffers on the data bus. Usually used with $\overline{\text{BCTL0}}$. The exact function of this pin is defined by the value of SIUMCR[BCTL1C]. See the <i>System Interface Unit (SIU)</i> chapter in the <i>MSC8103 Reference Manual</i> for details.
BADDR[27-28]	Output	Burst Address 27-28 Two of five outputs of the memory controller. These pins connect directly to memory devices controlled by the MSC8103 memory controller.
ALE	Output	Address Latch Enable Controls the external address latch used in external master bus configuration.
$\overline{\text{BCTL0}}$	Output	Buffer Control 0 Controls buffers on the data bus. The exact function of this pin is defined by the value of SIUMCR[BCTL0C]. See the <i>System Interface Unit (SIU)</i> chapter in the <i>MSC8103 Reference Manual</i> for details.
$\overline{\text{PWE}}[0-7]$	Output	Bus Write Enable Outputs of the bus General-Purpose Chip-select Machine (GPCM). These pins select byte lanes for write operations.
$\overline{\text{PSDDQM}}[0-7]$	Output	Bus SDRAM DQM Outputs of the SDRAM control machine. These pins select specific byte lanes of SDRAM devices.
$\overline{\text{PBS}}[0-7]$	Output	Bus UPM Byte Select Outputs of the User-Programmable Machine (UPM) in the memory controller. These pins select specific byte lanes during memory operations. The timing of these pins is programmed in the UPM. The actual driven value depends on the address and size of the transaction and the port size of the accessed device.

Table 1-6. Memory Controller Signals (Continued)

Signal	Data Flow	Description
PSDA10	Output	Bus SDRAM A10 Output from the bus SDRAM controller. This pin is part of the address when a row address is driven. It is part of the command when a column address is driven.
PGPL0	Output	Bus UPM General-Purpose Line 0 One of six general-purpose output lines of the UPM. The values and timing of this pin are programmed in the UPM.
$\overline{\text{PSDWE}}$	Output	Bus SDRAM Write Enable Output from the bus SDRAM controller. This pin should connect to the SDRAM WE input signal.
PGPL1	Output	Bus UPM General-Purpose Line 1 One of six general-purpose output lines from the UPM. The values and timing of this pin are programmed in the UPM.
$\overline{\text{POE}}$	Output	Bus Output Enable Output of the bus GPCM. Controls the output buffer of memory devices during read operations.
$\overline{\text{PSDRAS}}$	Output	Bus SDRAM RAS Output from the bus SDRAM controller. This pin should connect to the SDRAM Row Address Strobe (RAS) input signal.
PGPL2	Output	Bus UPM General-Purpose Line 2 One of six general-purpose output lines from the UPM. The values and timing of this pin are programmed in the UPM.
$\overline{\text{PSDCAS}}$	Output	Bus SDRAM CAS Output from the bus SDRAM controller. This pin should connect to the SDRAM Column Address Strobe (CAS) input signal.
PGPL3	Output	Bus UPM General-Purpose Line 3 One of six general-purpose output lines from the UPM. The values and timing of this pin are programmed in the UPM.
$\overline{\text{PGTA}}$	Input	GPCM TA Terminates transactions during GPCM operation. Requires an external pull up resistor for proper operation.
PUPMWAIT	Input	Bus UPM Wait Input to the UPM. An external device can hold this pin high to force the UPM to wait until the device is ready for the operation to continue.
$\overline{\text{PPBS}}$	Output	Bus Parity Byte Select In systems that store data parity in a separate chip, this output is the byte-select for that chip.
PGPL4	Output	Bus UPM General-Purpose Line 4 One of six general-purpose output lines from the UPM. The values and timing of this pin are programmed in the UPM.
PSDAMUX	Output	Bus SDRAM Address Multiplexer Controls the SDRAM address multiplexer when the MSC8103 is in External Master mode.
PGPL5	Output	Bus UPM General-Purpose Line 5 One of six general-purpose output lines from the UPM. The values and timing of this pin are programmed in the UPM.

1.6 CPM Ports

The MSC8103 CPM supports the subset of MPC8260 signals as described below.

- The MSC8103 CPM includes the following set of communication controllers:
- Two full-duplex fast serial communications controllers (FCCs) that support:
 - Asynchronous transfer mode (ATM) through a UTOPIA 8 interface (FCC1 only)—The MSC8103 can operate as one of the following:
 - UTOPIA slave device
 - UTOPIA multi-PHY master device using direct polling for up to 4 PHY devices
 - UTOPIA multi-PHY master device using multiplex polling that can address up to 31 PHY devices at addresses 0–30 (address 31 is reserved as a null port).
 - IEEE 802.3/Fast Ethernet through a Media-Independent Interface (MII)
 - High-level data link control (HDLC) Protocol:
 - Serial mode—Transfers data one bit at a time
 - Nibble mode—Transfers data four bits at a time
 - Transparent mode serial operation
- One FCC that operates with the TSA only
- Two multi-channel controllers (MCCs) that together can handle up to 256 HDLC/transparent channels at 64 Kbps each, multiplexed on up to four TDM interfaces
- Two full-duplex serial communications controllers (SCCs) that support the following protocols:
 - IEEE 802.3/fast Ethernet through a media-independent interface (MII)
 - HDLC Protocol:
 - Serial mode—Transfers data one bit at a time
 - Nibble mode—Transfers data four bits at a time
 - Synchronous data link control (SDLC)
 - LocalTalk (HDLC-based local area network protocol)
 - Universal asynchronous receiver/transmitter (UART)
 - Synchronous UART (1x clock mode)
 - Binary synchronous (BISYNC) communication
 - Transparent mode serial operation
- Two additional SCCs that operate with the TSA only
- Two full-duplex serial management controllers (SMCs) that support the following protocols:
 - General circuit interface (GCI)/integrated services digital network (ISDN) monitor and C/I channels (TSA only)
 - UART
 - Transparent mode serial operation
- Serial peripheral interface (SPI) support for master or slave operation
- Inter-integrated circuit (I²C) bus controller
- Time-slot assigner (TSA) that supports multiplexing from any of the SCCs, FCCs, SMCs, and two MCCs onto four time-division multiplexed (TDM) interfaces. The TSA uses two serial interfaces (SI1 and SI2). SI1 uses TDMA1 which supports both serial and nibble mode. SI2 does not support nibble mode and includes TDMB2, TDMC2, and TDMD2, which operate only in serial mode.

The individual sets of external signals associated with a specific protocol and data transfer mode are multiplexed across any or all of the ports, as shown in **Figure 1-2**. The following sections describe the signals supported by Ports A–D.

1.6.1 Port A Signals

Table 1-7. Port A Signals

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA31	FCC1: $\overline{\text{TXENB}}$ <i>UTOPIA master</i>	Output	FCC1: UTOPIA Master Transmit Enable Asserted by the MSC8103 (UTOPIA master PHY) when there is valid transmit cell data (TXD[0–7]).
	FCC1: $\overline{\text{TXENB}}$ <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Slave Transmit Enable Asserted by an external UTOPIA master PHY when there is valid transmit cell data (TXD[0–7]).
	FCC1: COL <i>MII</i>	Input	FCC1: Media Independent Interface Collision Detect Asserted by an external fast Ethernet PHY when collision is detected.
PA30	FCC1: TXCLAV <i>UTOPIA slave</i>	Output	FCC1: UTOPIA Slave Transmit Cell Available Asserted by the MSC8103 (UTOPIA slave PHY) when the MSC8103 can accept one complete ATM cell.
	FCC1: TXCLAV <i>UTOPIA master, or</i>	Input	FCC1: UTOPIA Master Transmit Cell Available Asserted by an external UTOPIA slave PHY to indicate that it can accept one complete ATM cell.
	FCC1: TXCLAV0 <i>UTOPIA master, Multi-PHY, direct polling</i>	Input	FCC1: UTOPIA Master Transmit Cell Available Multi-PHY Direct Polling Asserted by an external UTOPIA slave PHY using direct polling to indicate that it can accept one complete ATM cell.
	FCC1: $\overline{\text{RTS}}$ <i>HDLC, Serial and Nibble</i>	Output	FCC1: Request To Send In the standard modem interface signals supported by FCC1 ($\overline{\text{RTS}}$, $\overline{\text{CTS}}$, and $\overline{\text{CD}}$). $\overline{\text{RTS}}$ is asynchronous with the data. $\overline{\text{RTS}}$ is typically used in conjunction with $\overline{\text{CD}}$. The MSC8103 FCC1 transmitter requests the receiver to send data by asserting $\overline{\text{RTS}}$ low. The request is accepted when $\overline{\text{CTS}}$ is returned low.
FCC1: CRS <i>MII</i>	Input	FCC1: Media Independent Interface Carrier Sense Asserted by an external fast Ethernet PHY to indicate activity on the cable.	
PA29	FCC1: TXSOC <i>UTOPIA master</i>	Output	FCC1: UTOPIA Transmit Start of Cell Asserted by the MSC8103 (UTOPIA master PHY) when TXD[0–7] contains the first valid byte of the cell.
	FCC1: TX_ER <i>MII</i>	Output	FCC1: Media Independent Interface Transmit Error Asserted by the MSC8103 to force propagation of transmit errors.
PA28	FCC1: $\overline{\text{RXENB}}$ <i>UTOPIA master</i>	Output	FCC1: UTOPIA Master Receive Enable Asserted by the MSC8103 (UTOPIA master PHY) to indicate that RXD[0–7] and RXSOC are to be sampled at the end of the next cycle. RXD[0–7] and RXSOC are enabled only in cycles following those with $\overline{\text{RXENB}}$ asserted.
	FCC1: $\overline{\text{RXENB}}$ <i>UTOPIA slave</i>	Input	FCC1: UTOPIA Master Receive Enable Asserted by an external PHY to indicate that RXD[0–7] and RXSOC is to be sampled at the end of the next cycle. RXD[0–7] and RXSOC are enabled only in cycles following those with $\overline{\text{RXENB}}$ asserted.
	FCC1: TX_EN <i>MII</i>	Output	FCC1: Media Independent Interface Transmit Enable Asserted by the MSC8103 when transmitting data.

Table 1-7. Port A Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA27	FCC1: RXSOC <i>UTOPIA slave</i>	Output	FCC1: UTOPIA Receive Start of Cell Asserted by the MSC8103 (UTOPIA slave) for an external PHY when RXD[0–7] contains the first valid byte of the cell.
	FCC1: RX_DV <i>MII</i>	Input	FCC1: Media Independent Interface Receive Data Valid Asserted by an external fast Ethernet PHY to indicate that valid data is being sent. The presence of carrier sense but not RX_DV indicates reception of broken packet headers, probably due to bad wiring or a bad circuit.
PA26	FCC1: RXCLAV <i>UTOPIA slave</i>	Output	FCC1: UTOPIA Slave Receive Cell Available Asserted by the MSC8103 (UTOPIA slave PHY) when one complete ATM cell is available for transfer.
	FCC1: RXCLAV <i>UTOPIA master, or</i>	Input	FCC1: UTOPIA Master Receive Cell Available Asserted by an external PHY when one complete ATM cell is available for transfer.
	RXCLAV0 <i>UTOPIA master, Multi-PHY, direct polling</i>	Input	FCC1: UTOPIA Master Receive Cell Available 0 Direct Polling Asserted by an external PHY when one complete ATM cell is available for transfer.
	FCC1: RX_ER <i>MII</i>	Input	FCC1: Media Independent Interface Receive Error Asserted by an external fast Ethernet PHY to indicate a receive error, which often indicates bad wiring.
PA25	FCC1: TXD0 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 0 The MSC8103 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. TXD0 is the least significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	SDMA: MSNUM0	Output	Module Serial Number Bit 0 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.
PA24	FCC1: TXD1 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 1 The MSC8103 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 1 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	SDMA: MSNUM1	Output	Module Serial Number Bit 1 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.
PA23	FCC1: TXD2 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 2 The MSC8103 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 2 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.

Table 1-7. Port A Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA22	FCC1: TXD3 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 3 The MSC8103 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 3 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
PA21	FCC1: TXD4 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 4 The MSC8103 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 4 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	FCC1: TXD3 <i>MII and HDLC nibble</i>	Output	FCC1: MII and HDLC Nibble Transmit Data Bit 3 TXD[3–0] supports MII and HDLC nibble modes in FCC1. TXD3 is the most significant bit.
PA20	FCC1: TXD5 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 5 The MSC8103 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 5 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	FCC1: TXD2 <i>MII and HDLC nibble</i>	Output	FCC1: MII and HDLC Nibble Transmit Data Bit 2 TXD[3–0] is supported by MII and HDLC nibble modes in FCC1. This is bit 2 of the transmit data. TXD3 is the most significant bit.
PA19	FCC1: TXD6 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 6 The MSC8103 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. This is bit 6 of the transmit data. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	FCC1: TXD1 <i>MII and HDLC nibble</i>	Output	FCC1: MII and HDLC Nibble Transmit Data Bit 1 TXD[3–0] is supported by MII and HDLC transparent nibble modes in FCC1. This is bit 1 of the transmit data. TXD3 is the most significant bit.
PA18	FCC1: TXD7 <i>UTOPIA</i>	Output	FCC1: UTOPIA Transmit Data Bit 7. The MSC8103 outputs ATM cell octets (UTOPIA interface data) on TXD[0–7]. TXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes.
	FCC1: TXD0 <i>MII and HDLC nibble</i>	Output	FCC1: MII and HDLC Nibble Transmit Data Bit 0 TXD[3–0] is supported by MII and HDLC nibble modes in FCC1. TXD0 is the least significant bit.
	FCC1: TXD <i>HDLC serial and transparent</i>	Output	FCC1: HDLC Serial and Transparent Transmit Data Bit This is the single transmit data bit in supported by HDLC serial and transparent modes.

Table 1-7. Port A Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA17	FCC1: RXD7 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 7. The MSC8103 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. RXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	FCC1: RXD0 <i>MII and HDLC nibble</i>	Input	FCC1: MII and HDLC Nibble Receive Data Bit 0 RXD[3–0] is supported by MII and HDLC nibble mode in FCC1. RXD0 is the least significant bit.
	FCC1: RXD <i>HDLC serial and transparent</i>	Input	FCC1: HDLC Serial and Transparent Receive Data Bit This is the single receive data bit supported by HDLC and transparent modes.
PA16	FCC1: RXD6 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 6. The MSC8103 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. This is bit 6 of the receive data. RXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	FCC1: RXD1 <i>MII and HDLC nibble</i>	Input	FCC1: MII and HDLC Nibble Receive Data Bit 1 This is bit 1 of the receive nibble data. RXD3 is the most significant bit.
PA15	FCC1: RXD5 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 5 The MSC8103 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. This is bit 5 of the receive data. RXD7 is the most significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	RXD2 <i>MII and HDLC nibble</i>	Input	FCC1: MII and HDLC Nibble Receive Data Bit 2 This is bit 2 of the receive nibble data. RXD3 is the most significant bit.
PA14	FCC1: RXD4 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 4. The MSC8103 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. RXD7 is the most significant bit. RXD0 is the least significant bit. When no ATM data is available, idle cells are inserted. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	FCC1: RXD3 <i>MII and HDLC nibble</i>	Input	FCC1: MII and HDLC Nibble Receive Data Bit 3 RXD3 is the most significant bit of the receive nibble bit.
PA13	FCC1: RXD3 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 3 The MSC8103 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. RXD7 is the most significant bit. RXD0 is the least significant bit. A cell is 53 bytes. To support Multi-PHY configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	SDMA: MSNUM2	Output	Module Serial Number Bit 2 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.

Table 1-7. Port A Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA12	FCC1: RXD2 <i>UTOPIA</i>	Input	FCC1: UTOPIA Receive Data Bit 2 The MSC8103 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. This is bit 2 of the receive data. RXD7 is the most significant bit. A cell is 53 bytes. To support <u>Multi-PHY</u> configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	SDMA: MSNUM3	Output	Module Serial Number Bit 3 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.
PA11	FCC1: RXD1 <i>UTOPIA</i>	Input	FCC1: UTOPIA RX Receive Data Bit 1 The MSC8103 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. This is bit 1 of the receive data. RXD7 is the most significant bit. A cell is 53 bytes. To support <u>Multi-PHY</u> configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	SDMA: MSNUM4	Output	Module Serial Number Bit 4 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.
PA10	FCC1: RXD0 <i>UTOPIA</i>	Input	FCC1: UTOPIA RX Receive Data Bit 0 The MSC8103 inputs ATM cell octets (UTOPIA interface data) on RXD[0–7]. RXD0 is the least significant bit of the receive data. A cell is 53 bytes. To support <u>Multi-PHY</u> configurations, RXD[0–7] is tri-stated, enabled only when RXENB is asserted.
	SDMA: MSNUM5	Output	Module Serial Number Bit 5 The MSNUM has 6 bits that identify devices using the serial DMA (SDMA) modules. MSNUM[0–4] is the sub-block code of the current peripheral controller using SDMA. MSNUM5 indicates the section, transmit (0) or receive (1), that is active during the transfer. The information is recorded in the SDMA transfer error registers.
PA9	SMC2: SMTXD	Output	SMC2: Serial Management Transmit Data The SMC interface consists of SMTXD, SMRXD, <u>SMSYN</u> , and a clock. Not all signals are used for all applications. SMCs are full-duplex ports that supports three protocols or modes: UART, transparent, or general-circuit interface (GCI). See also PC15.
	SI1 TDMA1: L1TXD0 <i>TDM nibble</i>	Output	Time-Division Multiplexing A1: Layer 1 Transmit Data Bit 0 L1TXD0 is the least significant bit of the TDM nibble data.
PA8	SMC2: SMRXD	Input	SMC2: Serial Management Receive Data The SMC interface consists of SMTXD, SMRXD, <u>SMSYN</u> , and a clock. Not all signals are used for all applications. SMCs are full-duplex ports that supports three protocols or modes: UART, transparent, or general-circuit interface (GCI).
	SI1 TDMA1: L1RXD0 <i>TDM nibble</i>	Input	Time-Division Multiplexing A1: Layer 1 Nibble Receive Data Bit 0 L1RXD0 is the least significant bit received in nibble mode.
	SI1 TDMA1: L1RXD <i>TDM serial</i>	Input	Time-Division Multiplexing A1: Layer 1 Serial Receive Data TDMA1 receives serial data from L1RXD.

Table 1-7. Port A Signals (Continued)

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated Signal Protocol		
PA7	SMC2: SMSYN	Input	SMC2: Serial Management Synchronization The SMC interface consists of SMTXD, SMRXD, SMSYN, and a clock. Not all signals are used for all applications. SMCs are full-duplex ports that supports three protocols or modes: UART, transparent, or general-circuit interface (GCI).
	SI1 TDMA1: L1TSYNC <i>TDM nibble and TDM serial</i>	Input	Time-Division Multiplexing A1: Layer 1 Transmit Synchronization The synchronizing signal for the transmit channel. See the <i>Serial Interface with time-slot assigner</i> chapter in the <i>MSC8103 Reference Manual</i> .
PA6	SI1 TDMA1: L1RSYNC <i>TDM nibble and TDM serial</i>	Input	Time-Division Multiplexing A1: Layer 1 Receive Synchronization. The synchronizing signal for the receive channel.

1.6.2 Port B Signals

Table 1-8. Port B Signals

Name		Dedicated I/O Data Direction	Description
General-Purpose I/O	Peripheral Controller: Dedicated I/O Protocol		
PB31	FCC2: TX_ER <i>MII</i>	Output	FCC2: Media Independent Interface Transmit Error Asserted by the MSC8103 to force propagation of transmit errors.
	SCC2: RXD	Input	SCC2: Receive Data SCC2 receives serial data from RXD.
	SI2 TDMB2: L1TXD <i>TDM serial</i>	Output	Time-Division Multiplexing B2: Layer 1 Transmit Data TDMB2 transmits serial data out of L1TXD.
PB30	SCC2: TXD	Output	SCC2: Transmit Data. SCC2 transmits serial data out of TXD.
	FCC2: RX_DV <i>MII</i>	Input	FCC2: Media Independent Interface Receive Data Valid Asserted by an external fast Ethernet PHY to indicate that valid data is being sent. The presence of carrier sense, but not RX_DV, indicates reception of broken packet headers, probably due to bad wiring or a bad circuit.
	SI2 TDMB2: L1RXD <i>TDM serial</i>	Input	Time-Division Multiplexing B2: Layer 1 Receive Data TDMB2 receives serial data from L1RXD.
PB29	FCC2: TX_EN <i>MII</i>	Output	FCC2: Media Independent Interface Transmit Enable Asserted by the MSC8103 when transmitting data.
	SI2 TDMB2: L1RSYNC <i>TDM serial</i>	Input	Time-Division Multiplexing B2: Layer 1 Receive Synchronization The synchronizing signal for the receive channel.
