

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

**SINGLE VOLTAGE 3V ONLY FLASH MEMORY****FEATURES****GENERAL FEATURES**

- Power Supply Operation
  - 2.7 to 3.6 volt for read, erase, and program operations
  - V I/O voltage must tight with VCC
    - VI/O=VCC=2.7V~3.6V
- Byte/Word mode switchable
  - 8,388,608 x 8 / 4,194,304 x 16
- Sector architecture
  - MX29GL640E T/B: 127 x 32Kword(64KB) + 8 x 4Kword(8KB) boot sector
  - MX29GL640E H/L: 128 x 32Kword(64KB) Uniform sector
- 16-byte/8-word page read buffer
- 32-byte/16-word write buffer
- Extra 128-word sector for security
  - Features factory locked and identifiable, and customer lockable
- Advanced sector protection function (Solid and Password Protect)
- Latch-up protected to 100mA from -1V to 1.5xVcc
- Low Vcc write inhibit :  $V_{cc} \leq V_{LKO}$
- Compatible with JEDEC standard
  - Pinout and software compatible to single power supply Flash
- Deep power down mode

**PERFORMANCE**

- High Performance
  - Fast access time: 70ns
  - Page access time: 25ns
  - Fast program time: 10us/word
  - Fast erase time: 0.5s/sector (typical)
- Low Power Consumption
  - Low active read current: 10mA (typical) at 5MHz
  - Low standby current: 20uA (typical)
- Typical 100,000 erase/program cycle
- 20 years data retention

**SOFTWARE FEATURES**

- Program/Erase Suspend & Program/Erase Resume
  - Suspends sector erase operation to read data from or program data to another sector which is not being erased
  - Suspends sector program operation to read data from another sector which is not being program
- Status Reply
  - Data# Polling & Toggle bits provide detection of program and erase operation completion
- Support Common Flash Interface (CFI)

**HARDWARE FEATURES**

- Ready/Busy# (RY/BY#) Output
  - Provides a hardware method of detecting program and erase operation completion
- Hardware Reset (RESET#) Input
  - Provides a hardware method to reset the internal state machine to read mode
- WP#/ACC input pin
  - Hardware write protect pin/Provides accelerated program capability
  - MX29GL640E T/B: Protect Top or Bottom two sectors if WP#/ACC=Vil
  - MX29GL640E H/L: Protect first or last sector if WP#/ACC=Vil

**PACKAGE**

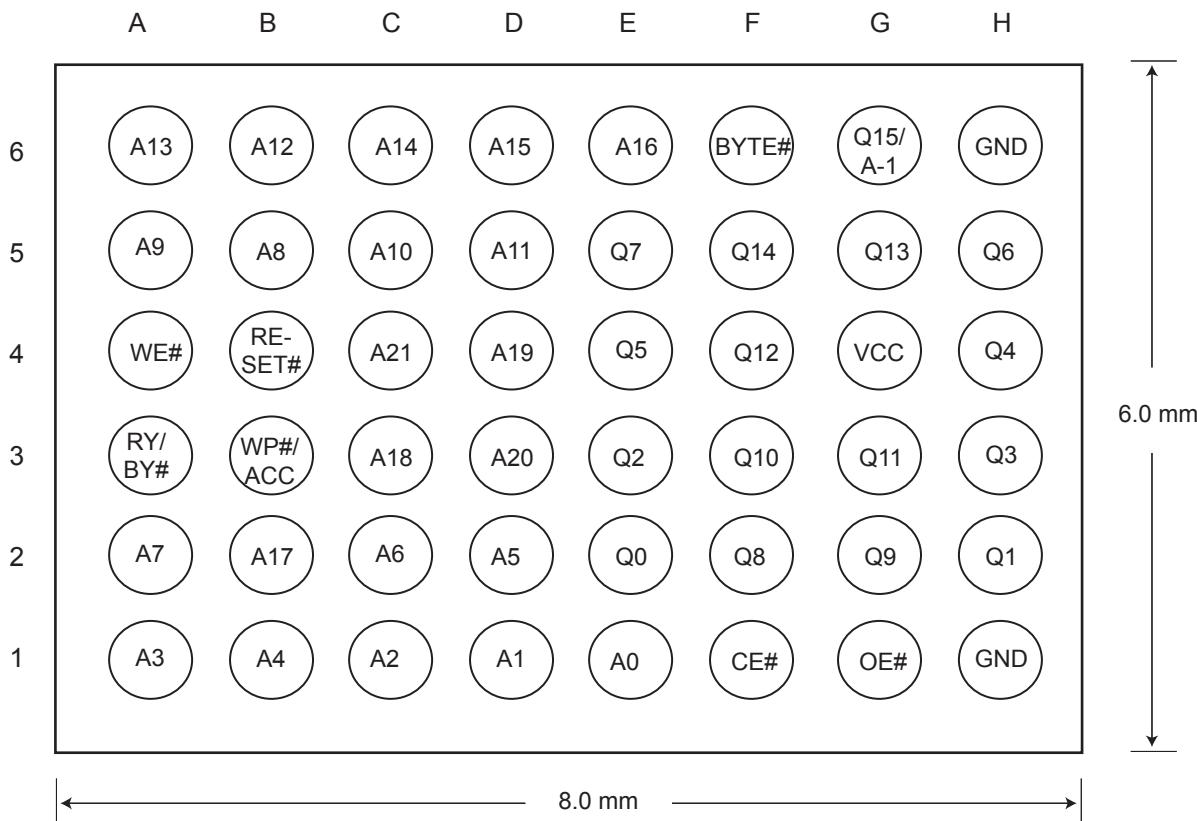

- MX29GL640E T/B
  - 48-pin TSOP
  - 48-ball LFBGA (6x8mm)
- MX29GL640E H/L
  - 56-pin TSOP
  - 64-ball LFBGA (11x13mm)
- All devices are RoHS Compliant and Halogen-free

**64 LFBGA**

### PIN DESCRIPTION

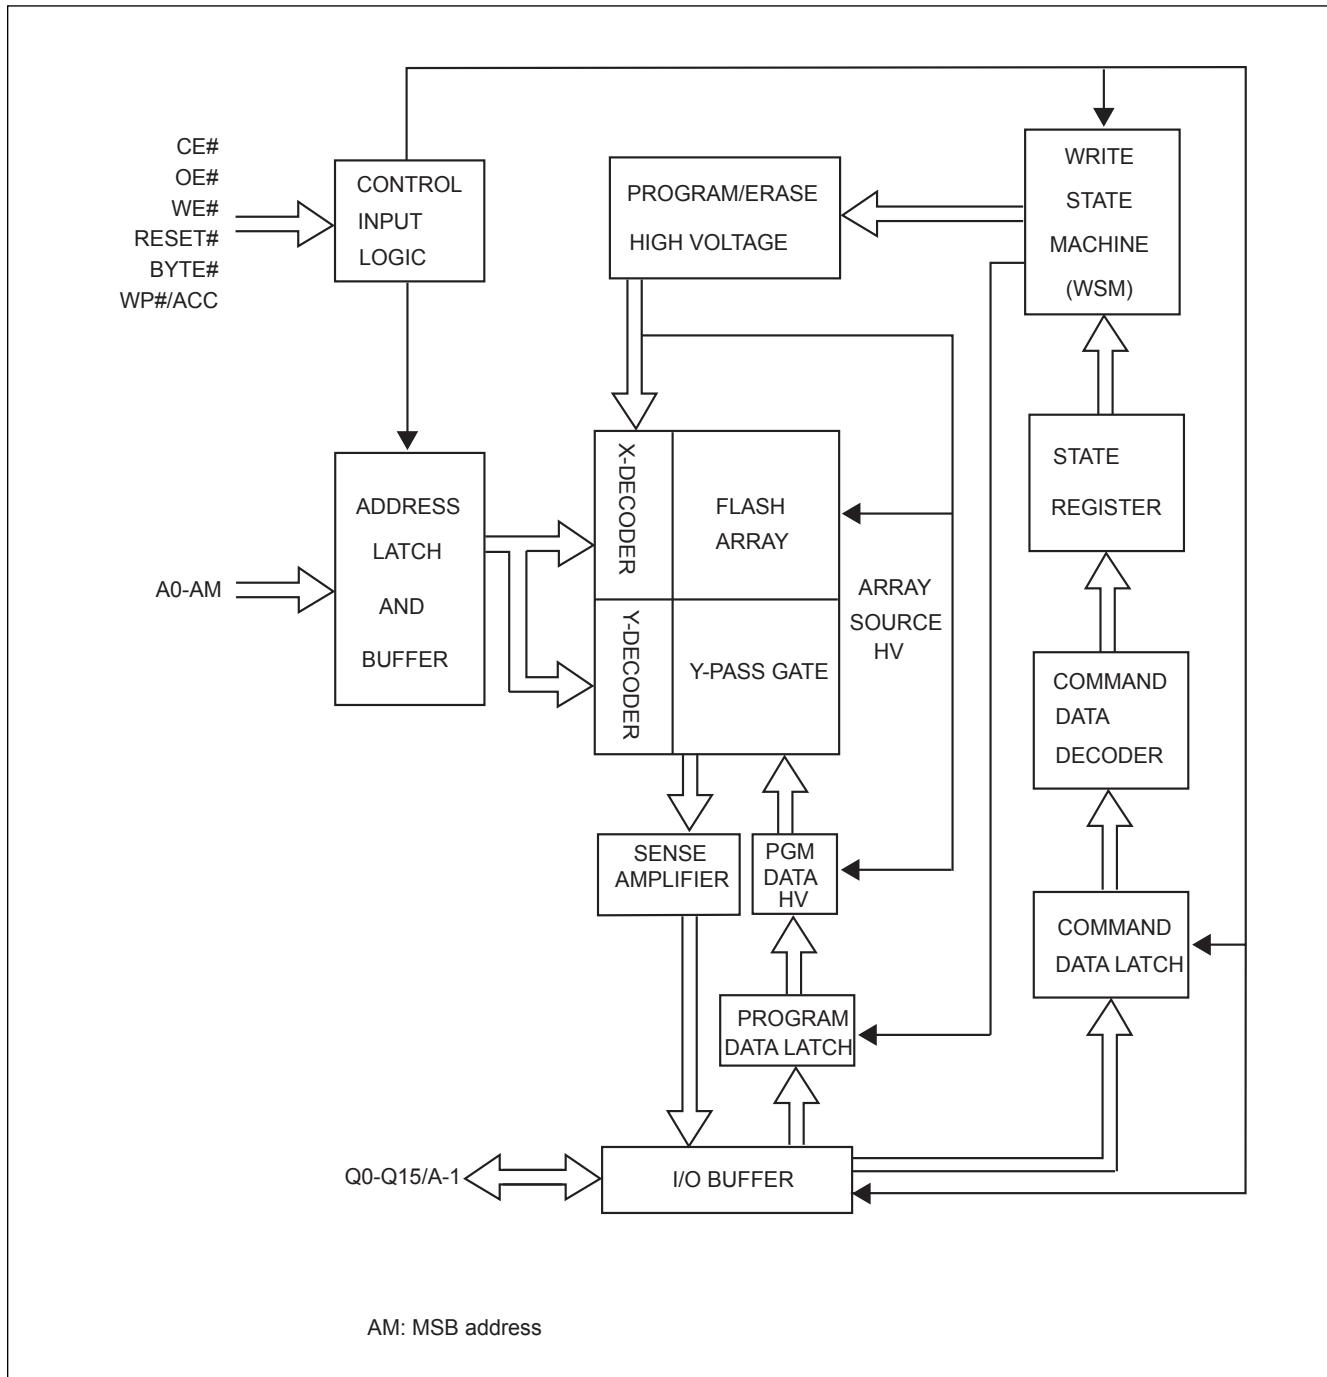

SYMBOL	PIN NAME
A0~A21	Address Input
Q0~Q14	Data Inputs/Outputs
Q15/A-1	Q15(Word Mode)/LSB addr(Byte Mode)
CE#	Chip Enable Input
WE#	Write Enable Input
OE#	Output Enable Input
RESET#	Hardware Reset Pin, Active Low
WP#/ACC*	Hardware Write Protect/Programming Acceleration input
RY/BY#	Read/Busy Output
BYTE#	Selects 8 bits or 16 bits mode
VCC	+3.0V single power supply
GND	Device Ground
NC	Pin Not Connected Internally
VI/O	Power Supply for Input/Output

### LOGIC SYMBOL

**Notes:**

1. WP#/ACC has internal pull up.
2. VI/O voltage must tight with VCC.  
VI/O = VCC = 2.7V~3.6V.

**BLOCK DIAGRAM**

## BLOCK DIAGRAM DESCRIPTION

The *block diagram* illustrates a simplified architecture of this device. Each block in the block diagram represents one or more circuit modules in the real chip used to access, erase, program, and read the memory array.

The "CONTROL INPUT LOGIC" block receives input pins CE#, OE#, WE#, RESET#, BYTE#, and WP#/ACC. It creates internal timing control signals according to the input pins and outputs to the "ADDRESS LATCH AND BUFFER" to latch the external address pins A0-AM. The internal addresses are output from this block to the main array and decoders composed of "X-DECODER", "Y-DECODER", "Y-PASS GATE", AND "FLASH ARRAY". The X-DECODER decodes the word-lines of the flash array, while the Y-DECODER decodes the bit-lines of the flash array. The bit lines are electrically connected to the "SENSE AMPLIFIER" and "PGM DATA HV" selectively through the Y-PASS GATES. SENSE AMPLIFIERS are used to read out the contents of the flash memory, while the "PGM DATA HV" block is used to selectively deliver high power to bit-lines during programming. The "I/O BUFFER" controls the input and output on the Q0-Q15/A-1 pads. During read operation, the I/O BUFFER receives data from SENSE AMPLIFIERS and drives the output pads accordingly. In the last cycle of program command, the I/O BUFFER transmits the data on Q0-Q15/A-1 to "PROGRAM DATA LATCH", which controls the high power drivers in "PGM DATA HV" to selectively program the bits in a word or byte according to the user input pattern.

The "PROGRAM/ERASE HIGH VOLTAGE" block comprises the circuits to generate and deliver the necessary high voltage to the X-DECODER, FLASH ARRAY, and "PGM DATA HV" blocks. The logic control module comprises of the "WRITE STATE MACHINE, WSM", "STATE REGISTER", "COMMAND DATA DECODER", and "COMMAND DATA LATCH". When the user issues a command by toggling WE#, the command on Q0-A15/A-1 is latched in the COMMAND DATA LATCH and is decoded by the COMMAND DATA DECODER. The STATE REGISTER receives the command and records the current state of the device. The WSM implements the internal algorithms for program or erase according to the current command state by controlling each block in the block diagram.

## ARRAY ARCHITECTURE

The main flash memory array can be organized as Byte mode (x8) or Word mode (x16). The details of the address ranges and the corresponding sector addresses are shown in [Table 1](#).

## BLOCK STRUCTURE

Table 1-1. MX29GL640ET SECTOR ARCHITECTURE

Sector Size		Sector	Sector Address A21-A12	(x8) Address Range	(x16) Address Range

**Notes:**

1. MX29GL640E T/B: Protect Top or Bottom two sectors if WP#/ACC=Vil.  
MX29GL640E H/L: Protect first or last sector if WP#/ACC=Vil.
2. When WP#/ACC = Vih, the protection conditions of the outmost sector depends on previous protection conditions. Refer to the advanced protect feature.
3. Q0~Q15 are input (DIN) or output (DOUT) pins according to the requests of command sequence, sector protection, or data polling algorithm.
4. In Word Mode (Byte#=Vih), the addresses are AM to A0, AM: MSB of address.  
In Byte Mode (Byte#=Vil), the addresses are AM to A-1 (Q15), AM: MSB of address.

**Table 2-2. BUS OPERATION**

Item	Control Input			AM to A12	A11 to A10	A9	A8 to A7	A6	A5 to A4	A3 to A2	A1	A0	Q7 ~ Q0	Q15 ~ Q8
	CE#	WE#	OE#											
Sector Lock Status Verification	L	H	L	SA	X	V <sub>hv</sub>	X	L	X	L	H	L	01h or 00h (Note 1)	X
Read Silicon ID Manufacturer Code	L	H	L	X	X	V <sub>hv</sub>	X	L	X	L	L	L	C2H	X
Read Silicon ID -- MX29GL640E T/B														
Cycle 1	L	H	L	X	X	V <sub>hv</sub>	X	L	X	L	L	H	7EH	22H(Word), XXH(Byte)
Cycle 2	L	H	L	X	X	V <sub>hv</sub>	X	L	X	H	H	L	10H	22H(Word), XXH(Byte)
Cycle 3	L	H	L	X	X	V <sub>hv</sub>	X	L	X	H	H	H	01H (Top) 00H (Bottom)	22H(Word), XXH(Byte)
Read Silicon ID -- MX29GL640E H/L														
Cycle 1	L	H	L	X	X	V <sub>hv</sub>	X	L	X	L	L	H	7EH	22H(Word), XXH(Byte)
Cycle 2	L	H	L	X	X	V <sub>hv</sub>	X	L	X	H	H	L	0CH	22H(Word), XXH(Byte)
Cycle 3	L	H	L	X	X	V <sub>hv</sub>	X	L	X	H	H	H	01H	22H(Word), XXH(Byte)

**Notes:**

1. Sector unprotected code:00h. Sector protected code:01h.
2. Factory locked code: WP# protects high address sector: 9Ah.  
WP# protects low address sector: 8Ah  
Factory unlocked code: WP# protects high address sector: 1Ah.  
WP# protects low address sector: 0Ah
3. AM: MSB of address.

## FUNCTIONAL OPERATION DESCRIPTION

### READ OPERATION

To perform a read operation, the system addresses the desired memory array or status register location by providing its address on the address pins and simultaneously enabling the chip by driving CE# & OE# LOW, and WE# HIGH. After the Tce and Toe timing requirements have been met, the system can read the contents of the addressed location by reading the Data (I/O) pins. If either the CE# or OE# is held HIGH, the outputs will remain tri-stated and no data will appear on the output pins.

### PAGE READ

This device is able to conduct MXIC MaskROM compatible high performance page read. Page size is 16 bytes or 8 words. The higher address Amax ~ A3 select the certain page, while A2~A0 for word mode, A2~A-1 for byte mode select the particular word or byte in a page. The page access time is Taa or Tce, following by Tpa for the rest of the page read time. When CE# toggles, access time is Taa or Tce. Page mode can be turned on by keeping "page-read address" constant and changing the "intra-read page" addresses.

### WRITE OPERATION

To perform a write operation, the system provides the desired address on the address pins, enables the chip by asserting CE# LOW, and disables the Data (I/O) pins by holding OE# HIGH. The system then places data to be written on the Data (I/O) pins and pulses WE# LOW. The device captures the address information on the falling edge of WE# and the data on the rising edge of WE#. To see an example, please refer to the timing diagram in [Figure 4](#). The system is not allowed to write invalid commands (commands not defined in this datasheet) to the device. Writing an invalid command may put the device in an undefined state.

### DEVICE RESET

Driving the RESET# pin LOW for a period of Trp or more will return the device to Read mode. If the device is in the middle of a program or erase operation, the reset operation will take at most a period of Tready1 before the device returns to Read mode. Until the device does returns to Read mode, the RY/BY# pin will remain Low (Busy Status).

When the RESET# pin is held at GND±0.3V, the device only consumes standby (Isbr) current. However, the device draws larger current if the RESET# pin is held at a voltage greater than GND+0.3V and less than or equal to Vil.

It is recommended to tie the system reset signal to the RESET# pin of the flash memory. This allows the device to be reset with the system and puts it in a state where the system can immediately begin reading boot code from it.

### STANDBY MODE

The device enters Standby mode whenever the RESET# and CE# pins are both held High except in the embedded mode. While in this mode, WE# and OE# will be ignored, all Data Output pins will be in a high impedance state, and the device will draw minimal (Isb) current.

**FUNCTIONAL OPERATION DESCRIPTION (cont'd)****OUTPUT DISABLE**

While in active mode (RESET# HIGH and CE# LOW), the OE# pin controls the state of the output pins. If OE# is held HIGH, all Data (I/O) pins will remain tri-stated. If held LOW, the Byte or Word Data (I/O) pins will drive data.

**BYTE/WORD SELECTION**

The BYTE# input pin is used to select the organization of the array data and how the data is input/output on the Data (I/O) pins. If the BYTE# pin is held HIGH, Word mode will be selected and all 16 data lines (Q0 to Q15) will be active.

If BYTE# is forced LOW, Byte mode will be active and only data lines Q0 to Q7 will be active. Data lines Q8 to Q14 will remain in a high impedance state and Q15 becomes the A-1 address input pin.

**HARDWARE WRITE PROTECT**

By driving the WP#/ACC pin LOW. The Top or Bottom two sectors (for MX29GL640E T/B) and the highest or lowest sector (for MX29GL640E H/L) was protected from all erase/program operations. If WP#/ACC is held HIGH (Vih to VCC), these sectors revert to their previously protected/unprotected status.

**ACCELERATED PROGRAMMING OPERATION**

By applying high voltage (Vhv) to the WP#/ACC pin, the device will enter the Accelerated Programming mode. This mode permits the system to skip the normal command unlock sequences and program byte/word locations directly. During accelerated programming, the current drawn from the WP#/ACC pin is no more than ICP1.

**WRITE BUFFER PROGRAMMING OPERATION**

Programs 32bytes/16words in a programming operation. To trigger the Write Buffer Programming, start by the first two unlock cycles, then third cycle writes the Write Buffer Load command at the destined programming Sector Address. The forth cycle writes the "word locations subtract one" number.

Following above operations, system starts to write the mingling of address and data. After the programming of the first address or data, the "write-buffer-page" is selected. The following data should be within the above mentioned page.

The "write-buffer-page" is selected by choosing address Amax-A4.

"Write-Buffer-Page" address has to be the same for all address/ data write into the write buffer. If not, operation will ABORT.

To program the content of the write buffer page this command must be followed by a write to buffer Program confirm command.

The operation of write-buffer can be suspended or resumed by the standard commands, once the write buffer programming operation is finished, it'll return to normal READ mode.
