

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

NCN6011

Low Power Level Shifter

The NCN6011 is a level shifter analog circuit designed to translate the voltages between a SIM Card and an external microcontroller. The device handles all the signals needed to control the data transaction between the external Card and the MPU.

Features

- 2.7 to 6.0 V Input and/or Output Voltage Range
- 500 nA Quiescent Supply Current
- All Pins are Fully ESD Protected
- Supports 10 MHz Clock
- Provides a Logic I/O Enable Function
- Rx/Tx Communication Capability

Typical Applications

- SIM/GSM/SMARTCARD Interface

ON Semiconductor™

NCN6011

ABBREVIATIONS

CLOCK	Input Logic Clock
RESET	Input Logic Reset
VDD	Interface Power Supply Input
SIM_VCC	Interface IC Card Power Supply Output
SIM_CLK	Interface IC Card Clock Output
SIM_RST	Interface IC Card Reset Output
SIM_IO	Interface IC Card I/O Signal Line
Class A	5.0 V Smart Card
Class B	3.0 V Smart Card

PIN DESCRIPTIONS (Pin numbers in parenthesis are related to the TSSOP-14 package) (Pin numbers in bold are related to the Micro-10 package)

Pin	Name	Type	Description
(1)	-	NA	No Connection. (TSSOP-14 Only)
1 (2)	I/O	INPUT	This pin is connected to an external microcontroller. A bidirectional level translator adapts the serial I/O signal between the smart card and the external controller. A built-in constant 20 k Ω typical resistor provides a high impedance state when not activated.
2 (3)	V _{DD}	POWER	This pin is connected to the system controller power supply and the input voltage can range from 2.7 to 6.0 V.
3 (4)	CLOCK	INPUT	The clock signal, coming from the external controller, must have a Duty Cycle within the Min/Max limits defined by the specification (typically 50%). The built-in level shifter translates the input signal to the external SIM card voltage supply.
4 (5)	RESET	INPUT	The RESET signal present at this pin is provided by the MPU. The internal level shifter translates the level according to the voltages applied to pin 3 and pin 12.
5 (6)	IO_ENABLE	INPUT	This logic input pin forces SIM_IO pin to Low when IO_ENABLE = Low, leaving this signal High when IO_ENABLE = High. The signal is not latched and the SIM_IO pin is released to a logic High when IO_ENABLE = High. When this condition is met, the SIM_IO logic status depends upon the signal presence pin I/O. When the MPU uses two different channels to exchange data with the SIM card, the IO_ENABLE pin can be used to as a Write line to the external card, the I/O pin being used to Read data from the SIM card.
(7)	-	NA	No Connection. (TSSOP-14 Only)
(8)	-	NA	No Connection. (TSSOP-14 Only)
6 (9)	GND	GROUND	This pin is the GROUND reference for the integrated circuit and associated signals. High frequency layout techniques are requested to connect the GND pin to the external functions.
7 (10)	SIM_RST	OUTPUT	This pin is connected to the RST pin of the card connector. A voltage level translator adapts the external RESET signal (coming from the MPU) to the smart card.
8 (11)	SIM_CLK	OUTPUT	This pin is connected to the CLK pin of the card connector. The CLOCK signal comes from the external clock generator. The internal voltage level shifter adapts the clock signal flowing through this link. Care must be observed to prevent AC coupling with adjacent lines and signals PCB tracks.
9 (12)	SIM_VCC	POWER	This pin is connected to the smart card VCC power supply pin. The voltage, provided by an external power supply, can range from 2.7 V to 6.0 V. The NCN6011 does not regulate or protect the voltage supply applied to the external card.
10 (13)	SIM_I/O	OUTPUT	This pin handles the connection to the serial I/O of the card connector. A bidirectional voltage level translator adapts the serial I/O signal between the card and the microcontroller. A 20 k Ω typical pull up resistor provides a High impedance state for the SIM card I/O link.
(14)	-	NA	No Connection. (TSSOP-14 Only)

Level Shifters

The built-in level shifters accommodate the differential voltage between the external MPU and the SIM card. Neither the logic nor the functions of the SIM signals are affected by the interface.

The NCN6011 does not regulate the SIM_VCC, nor does it detect the overload current.

Bidirectional Level Shifter

The NCN6011 carries out the voltage difference between the MPU and the Smart Card I/O signals. When the start sequence is completed, and if no failures have been detected, the device becomes essentially transparent for the data transferred on the I/O line. To fulfill the ISO7816-3 specification, both sides of the I/O line have built-in pulsed circuitry to accelerate the signal rise transient. The I/O line is connected on both sides of the interface by a NMOS switch which provide the level shifter and, thanks to its relative high internal impedance, protects the Smart Card in the event of data collision. Such a situation could occur if either the MPU of the smart card forces a signal in the opposite logic level direction.

Figure 7. Basic Internal I/O Level Shifter

Figure 8. Typical I/O and SIM_IO Waveform,
V_{DD} = V_{CC} = 5.0 V, ENABLE = Low

Figure 9. Typical SIM_IO Activated by ENABLE
Pin, I/O = High (open drain)

Input Schmitt Triggers

All the Logic Input pins have built-in Schmitt trigger circuits to prevent the NCN6011 against uncontrolled operation. The typical dynamic characteristics of the related pins are depicted in Figure 10.

The output signal is guaranteed to go High when the input voltage is above $0.70 \cdot V_{bat}$, and will go Low when the input voltage is below $0.30 \cdot V_{bat}$.

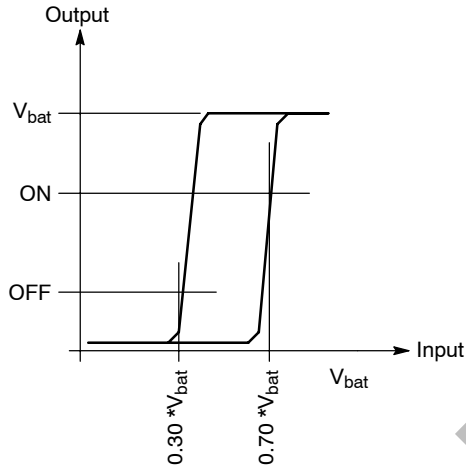

Figure 10. Typical Schmitt Trigger Characteristic

ESD Protection

The NCN6011 includes silicon devices to protect the pins against the ESD spikes voltages. To cope with the different ESD voltages developed across these pins, the built-in structures have been designed to handle either 2.0 kV, when related to the microcontroller side, or 4.0 kV when connected with the external contacts. Practically, the SIM_RST, SIMD_CLK and SIM_IO pins can sustain 4.0 kV.

Printed Circuit Board Layout

Since the NCN6011 carries high speed currents together with high frequency clock, the printed circuit board must be carefully designed to avoid the risk of uncontrolled operation of the interface.

Care must be observed to avoid common copper track sharing small signal and high power with a relative high impedance. On top of that, the clock signal (both input and output) shall be properly shielding to minimize the high frequency cross talk between this line and the rest of the circuit. In particular, the SIM_RST signal shall be protected from interference generated by the SIM_CLK line. Such protection can be achieved by surrounding the SIM_CLK track by a copper track connected to ground. Generally speaking, the ground plane shall be as large as possible for a given printed circuit board area.
