

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

2/3/4-Phase Controller with On Board Gate Drivers for CPU Applications

The NCP5395 provides up to a four-phase buck solution which combines differential voltage sensing, differential phase current sensing, adaptive voltage positioning, and on board gate drivers. Dual-edge pulse-width modulation (PWM) combined with inductor current sensing reduces system cost by providing the fastest initial response to dynamic load events. Dual-edge multiphase modulation reduces the total bulk and ceramic output capacitance required to meet transient regulation specifications.

The on board gate drivers includes adaptive non overlap and power saving operation. A high performance operational error amplifier is provided to simplify compensation of the system. Patented Dynamic Reference Injection further simplifies loop compensation by eliminating the need to compromise between closed-loop transient response and Dynamic V_{ID} performance.

Features

- Meets Intel's VR11.1 Specifications
- Meets AMD 6 Bit Code Specifications
- Dual-edge PWM for Fastest Initial Response to Transient Loading
- High Performance Operational Error Amplifier
- Internal Soft Start
- Dynamic Reference Injection (Patent #US07057381)
- DAC Range from 0.5 V to 1.6 V
- DAC Feed Forward Function (Patent Pending)
- $\pm 0.5\%$ DAC Voltage Accuracy from 1.0 V to 1.6 V
- True Differential Remote Voltage Sensing Amplifier
- Phase-to-Phase Current Balancing
- "Lossless" Differential Inductor Current Sensing
- Differential Current Sense Amplifiers for Each Phase
- Adaptive Voltage Positioning (AVP)
- Oscillator Frequency Range of 125 kHz – 1 MHz
- Latched Over Voltage Protection (OVP)
- Guaranteed Startup into Pre-Charged Loads
- Threshold Sensitive Enable Pin for VTT Sensing
- Power Good Output with Internal Delays
- Thermally Compensated Current Monitoring
- Thermal Shutdown Protection
- Adaptive-Non-Overlap Gate Drive Circuit
- Output Disable Control Turn Off of Both Phase Pair MOSFETs
- This is a Pb-Free Device

Applications

- Desktop Processors

FUNCTIONAL DESCRIPTIONS

General

The NCP5395 dual edge modulated multiphase PWM controller is specifically designed with the necessary features for a high current CPU system. The IC consists of the following blocks: Precision Flexible DAC, Differential Remote Voltage Sense Amplifier, High Performance Voltage Error Amplifier, Differential Current Feedback Amplifiers, Precision Oscillator and Saw-tooth Generator, and PWM Comparators with Hysteresis. The controller also supports power saving mode as per Intel VR11.1 by accurately monitoring the current and switching between multi-phase and single phase operations as requested by the microprocessor system. Protection features include: Undervoltage Lockout, Soft-Start, Overcurrent Protection, Overvoltage Protection, and Power Good Monitor.

Precision Programmable DAC

A precision flexible DAC is provided. The DAC will conform to 2 different specifications: AMD or VR11.1. The VID7/AMD pin is provided to determine which DAC specification will be used and which soft-start mode the part will use for power up. There are two soft-start modes. If VID7/AMD is above its threshold the device will soft-start and ramp directly to the DAC code present on the VID inputs. The following truth table describes the functionality:

VID7/AMD Pin	VID7	Enable Pin Mode	Soft Start Mode
Above AMD Threshold	Not active	AMD Thresholds	Ramp to VID
Below AMD Threshold	Active	VR11.1 Thresholds	Ramp to Vboot

VID INPUTS

VID0–VID7 control the target regulation voltage during normal operation. In AMD mode the VID capture is enabled just before soft start. In VR11 mode the VID capture is enabled at the end of the V_{BOOT} waiting period. If the VID is valid the DAC will track to it. If an invalid VID occurs it will be ignored for 10 μ s before the controller shuts down.

Remote Sense Amplifier

A high performance differential amplifier is provided to accurately sense the output voltage of the regulator. The non-inverting input should be connected to the regulator's output voltage. The inverting input should be connected to the return line of the regulator. Both connection points are intended to be at a remote point so that the most accurate reading of the output voltage can be obtained. The amplifier is configured in a very unique way. First, the gain of the amplifier is internally set to unity. Second, both the inverting and non-inverting inputs of the amplifier are summing nodes. The inverting input sums the output voltage return

voltage with the DAC voltage. The non-inverting input sums the remote output voltage with a 1.3 V reference. The resulting voltage at the output of the remote sense amplifier is:

$$V_{\text{Diffout}} = V_{\text{out}} + 1.3 \text{ V} - V_{\text{dac}} - V_{\text{outreturn}}$$

This signal then goes through a standard compensation circuit and into the inverting input of the error amplifier. The non-inverting input of the error amplifier is also connected to the 1.3 V reference. The 1.3 V reference then is subtracted out and the error signal at the comp pin of the error amplifier is as normally expected:

$$V_{\text{comp}} = V_{\text{dac}} - V_{\text{out}}$$

The non-inverting input of the remote sense amplifier is pulled low through a small current sink during a fault condition to prevent accidental charging of the regulator output.

2/3/4 Phase Operation

The part can be configured to 2-, 3-, or 4-phase mode. In 2- or 3-phase mode, the internal drivers will be used. In 4-phase mode, an external driver must be used to drive phase 4. The NCP5359 driver is suggested to be used with the controller. The input to G4 pin will decide which phase mode the system is in operation. Please refer to the Application Schematics for more information.

High Performance Voltage Error Amplifier

A high performance voltage error amplifier is provided. The error amplifier's inverting input is VFB and its output is COMP. A standard type 3 compensation circuit is used to compensate the system. This involves a 3 pole, 2 zero compensation network. The comp pin is pulled to ground before soft-start for smooth start up.

Differential Current Sense

Four differential amplifiers are provided to sense the output current of each phase. These current sense amplifiers sense the current through the corresponding phase. A voltage is generated across a current sense element such as an inductor or sense resistor. The sense element should be between 0.5 m Ω and 1.5 m Ω . It is possible to sense both negative and positive going current. The information is used to create the signal CSSUM and provide feedback for current sharing.

Precision Oscillator

A programmable precision oscillator is provided. This oscillator is programmed by the summed resistance of an oscillator resistor and a current limit resistor. The output voltage of this pin is used as the reference for the current limit. The oscillator frequency range is 125 KHz/phase to 1000 KHz/phase. The oscillator frequency is proportional to the current drawn out of the OSC pin.
