## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## NCP5612

## High Efficiency Ultra Small Thinnest White LED Driver

The NCP5612 product is a dual output LED driver dedicated to the LCD display backlighting.

The built-in DC/DC converter is based on a high efficient charge pump structure with operating mode 1 x and 1.5 x . It provides a peak $87 \%$ efficiency together with a $0.2 \%$ LED to LED matching.

## Features

- Support the Single Wire Serial Link Protocol
- Peak Efficiency $90 \%$ with 1x and $1.5 x$ Mode
- Programmable Dimming ICON Function
- Built-in Short Circuit Protection
- Provides 16 steps Current Control
- Controlled Start-up Inrush Current
- Built-in Automatic Open Load Protection
- Tight $0.2 \%$ Matching Tolerance
- Accurate 1\% Output Current Tolerance
- Smallest Available Package on the Market
- This is a Pb -Free Device

## Typical Applications

- Portable Back Light
- Digital Cellular Phone Camera Photo Flash
- LCD and Key Board Simultaneous Drive

PIN FUNCTION DESCRIPTION

| Pin No. | Symbol | Function | Description |
| :---: | :---: | :---: | :---: |
| 1 | GND | POWER | This pin is the GROUND signal for the power analog blocks and must be connected to the system ground. This pin is the GROUND reference for the DC/DC converter and the output current control. The pin must be connected to the system ground, a ground plane being strongly recommended. |
| 2 | LED1 | INPUT, POWER | This pin sinks to ground and monitors the current flowing into the first LED, intended to be used in backlight application. The current is limited to 30 mA maximum (Note 2). <br> The LED1 is deactivated when the ICON bit of the LED-REG register is High. The LED1 is automatically disconnected when an open load is sensed pin 2 during the operation. |
| 3 | LED2 | INPUT, POWER | This pin sinks to ground and monitors the current flowing into the second LED, intended to be used in backlight application. The current is limited to 30 mA maximum (Note 2). The LED2 fulfills the ICON function, LED1 being deactivated, when the ICON bit of the LED-REG register is High. The LED2 is automatically disconnected when an open load is sensed pin 3 during the operation. |
| 4 | $\mathrm{I}_{\text {REF }}$ | INPUT, ANALOG | This pin provides the reference current, based on the internal band-gap voltage reference, to control the output current flowing in the LED. A $1 \%$ tolerance, or better, resistor shall be used to get the highest accuracy of the LED biases. An external current source can be used to bias this pin to dim the light coming out of the LED. <br> In no case shall the voltage at pin 4 be forced either higher or lower than the 600 mV provided by the internal reference. |
| 5 | CNTL | INPUT, DIGITAL | This pin supports the flow of data between the external MCU and the NCP5612 internal registers. The protocol makes profit of a Single Wire structure associated to a Serial 8 bits format data flow. |
| 6 | NC | - | No internal connection |
| 7 | $\mathrm{V}_{\text {OUT }}$ | OUTPUT, POWER | This pin provides the output voltage supplied by the DC/DC converter. The $\mathrm{V}_{\text {out }}$ pin must be decoupled to ground by a $1 \mu \mathrm{~F}$ ceramic capacitor located as close as possible to the pin. Cares must be observed to minimize the parasitic inductance at this pin. The circuit shall not operate without such bypass capacitor connected across the $\mathrm{V}_{\text {out }}$ pin and ground. <br> The output voltage is internally clamped to 5.5 V maximum in the event of no load situation. On the other hand, the output current is limited to 40 mA (typical) in the event of a short circuit to ground. |
| 8 | C2P | POWER | One side of the external charge pump capacitor ( $\mathrm{C}_{\mathrm{FLY}}$ ) is connected to this pin, associated with C2N (Note 1) |
| 9 | C2N | POWER | One side of the external charge pump capacitor ( $\mathrm{C}_{\mathrm{FLY}}$ ) is connected to this pin, associated with C2P (Note 1) |
| 10 | C1P | POWER | One side of the external charge pump capacitor ( $\mathrm{C}_{\mathrm{FLY}}$ ) is connected to this pin, associated with C1N (Note 1) |
| 11 | $\mathrm{V}_{\text {BAT }}$ | INPUT, POWER | Input Battery voltage to supply the analog and digital blocks. The pin must be decoupled to ground by a $1.0 \mu \mathrm{~F}$ minimum ceramic capacitor. |
| 12 | C1N | POWER | One side of the external charge pump capacitor ( $\mathrm{C}_{\mathrm{FLY}}$ ) is connected to this pin, associated with C1P (Note 1) |

1. Using low ESR ceramic capacitor, $50 \mathrm{~m} \Omega$ maximum, is mandatory to optimize the Charge Pump efficiency.
2. Total DC/DC output current is limited to 60 mA .

MAXIMUM RATINGS

## APPLICATION INFORMATION

Figure 3. Timings Reference

Figure 4. Basic Cellular Phone Chip Set Digital Output Levels

## DC/DC Operation

The converter is based on a charge pump technique to generate a DC voltage capable to supply the White LED load. The system regulates the current flowing into each LED by means of internal current mirrors associated with the white diodes. Consequently, the output voltage will be equal to the $\mathrm{V}_{\mathrm{f}}$ of the LED, plus the drop voltage (ranging from 150 mV to 400 mV , depending upon the output current and $\mathrm{V}_{\text {bat }}$ / $\mathrm{V}_{\mathrm{f}}$ ratio) developed across the internal NMOS mirror. Typically, assuming a standard white LED forward biased at 10 mA , the output voltage will be 3.6 V .

The built-in OVP circuit continuously monitors the output voltage and stops the converter when the voltage is above 5.0 V typical. The converter resumes to normal operation when the voltage drops below the typical 5.0 V (no latch-up mechanism). Consequently, the chip can operate with no load during any test procedures.

## Load Current Calculation

The load current is derived from the 600 mV reference voltage provided by the internal Band Gap associated to the
external resistor connected across $\mathrm{I}_{\text {REF }}$ pin and Ground (see Figure 5). In any case, no voltage shall be forced at $\mathrm{I}_{\text {REF }}$ pin, either downward or upward.
The reference current is multiplied by the internal current mirror, associated to the number of pulses as depicted Figure 9, to yield the output load current. Since the reference voltage is based on a temperature compensated Band Gap, a tight tolerance resistor will provide a very accurate load current. The resistor is calculated from the Ohm's law ( $\mathrm{R}_{\text {bias }}=\mathrm{V}_{\text {ref }} / \mathrm{I}_{\text {REF }}$ ) and define the maximum current flowing into the LED when 20 pulses have been counted at the CNTL pin.

Since the reference current must be between the minimum and maximum specified, the resistor value will range between $\mathrm{R}_{\text {bias }}=300 / 30 \mathrm{~mA}=10 \mathrm{k} \Omega$ and $\mathrm{R}_{\text {bias }}=$ $300 / 0.5 \mathrm{~mA}=600 \mathrm{k} \Omega$. Obviously, the tolerance of such a resistor must be $1 \%$ or better, with a 100 ppm thermal coefficient, to get the expected overall tolerance.
Typical applications will run with $R_{\text {bias }}=10 \mathrm{k} \Omega$ to make profit of the full dynamic range provided by the S -Wire DATA byte.

Figure 5. Basic Reference Current Source

## Load Connection

The NCP5612 is capable to drive the two LED simultaneously, as depicted (see Figure 1), but the load can be arranged to accommodate one or two LED if necessary

in the application (see Figure 6). In this case, the two current mirrors can be connected in parallel to drive a single powerful LED, thus yielding 60 mA current capability in a single LED.

Figure 6. Typical Single and Double LED Connections

Finally, an external network can be connected across $\mathrm{V}_{\text {out }}$ and ground, but the current through such network will not be regulated by the NCP5612 chip (see Figure 7). On top of that, the total current out of the $V_{\text {out }}$ pin shall be limited to 60 mA .

Figure 7. Extra Load Connected to $\mathrm{V}_{\text {out }}$

## Single Wire Serial Link Protocol

The proposed S-WIRE uses a pulse count technique already existing in the data exchange systems. The protocol supports broken transmission, assuming the hold time is shorter than the maximum $200 \mu$ s typical specified in the data sheet. The S-WIRE details are provided in the AND8264 application note.

Based on the two examples provided in Figure 8, the CNTL pin supports two digital level:
CNTL $=$ Low $\rightarrow$ the system is shut-off and no current flow in either LED1 or LED2.
CNTL $=$ High $\rightarrow$ the system is active and the two LED are powered according to the selected sequence.
There is no time delay associated with the Low state and the LED are switched Off when the CNTL signal drops to Low. To program a new LED configuration, one shall send the number of pulses on the CNTL pin according to the true table:

- The internal counter is reset to zero on the first negative going transient present on the CNTL pin
- The first four positive going pulses are used to control the ICON (LED2):

1. Pulse \#1 $\rightarrow$ ICON $=100 \mu \mathrm{~A}$
2. Pulse \# $2 \rightarrow \mathrm{ICON}=150 \mu \mathrm{~A}$
3. Pulse $\# 3 \rightarrow \mathrm{ICON}=250 \mu \mathrm{~A}$
4. Pulse $\# 4 \rightarrow \mathrm{ICON}=450 \mu \mathrm{~A}$

- The fifth positive pulse will clear the ICON and activate the normal operation of LED1 and LED2
- The pulses from the fifth to the twentieth will increase the LED current according to a pseudo logarithmic scale (see Figure 9).
- Any pulses beyond the twentieth will not make change to the LED current if the delay between the pulses is shorter than $75 \mu \mathrm{~s}$.
- The system returns to zero if a pulse, delayed by $200 \mu \mathrm{~s}-\mathrm{T}_{\mathrm{dst}}-$, follows the twentieth one and the cycle restart from the beginning.
Once the expected LED current value is reached, the CNTL pin must stay High to store the new data and maintain the LED active.
The contain of the counter is stored into the internal LED registers at the end of the built-in $200 \mu$ s typical delay: no action will take place during the end of the last positive going pulse and the end of the $\mathrm{T}_{\text {dst }}$ delay. Such a protocol prevent the system for broken transmission.
On the other hand, in order to avoid corrupted data transmission, the High level shall be $75 \mu$ s maximum during a given data frame. Consequently, the pulse frequency is bounded by a 13 kHz minimum and a 400 kHz maximum.

Figure 8. Basic NCP5612 Programming Sequence

## DIMMING

The built-in Single Wire Serial Link interface provides a simple way to accurately control the output current flowing in the two LED. Provision have been made, at silicon level, to provide a full dimming of the backlight (NORMAL mode of operation), the ICON current being adjustable in four steps when it is activated.

Table 1. LED Dimming Configuration

| Pulse Count | LED activity |
| :--- | :--- |
| Pulse 1 | LED\#2 $=100 \mu \mathrm{~A}$, LED\#1 de-activated |
| Pulse 2 | LED\#2 $=150 \mu \mathrm{~A}$, LED\#1 de-activated |
| Pulse 3 | LED\#2 $=250 \mu \mathrm{~A}$, LED\#1 de-activated |
| Pulse 4 | LED\#2 $=450 \mu \mathrm{~A}$, LED\#1 de-activated |
| Pulse 5 to Pulse 20 | ICON de-activated, NORMAL back- <br> light takes place |

The DC/DC converter is switched OFF and the two LED are disconnected when LED-REG=\$00.

When the ICON mode is activated, the DC/DC converter is switched OFF, LED\#1 is deactivated from the LED current sense and the programmed bias current (powered from the $\mathrm{V}_{\text {bat }}$ source) is forced into LED\#2.

| Bit Clock | I-LED(mA) | Bit Clock | I-LED(mA) |
| :---: | :---: | :---: | :---: |
