Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

NCV4275C

450 mA Low-Drop Voltage Regulator with Reset

The NCV4275C is an integrated low dropout regulator designed for use in harsh automotive environments. It includes wide operating temperature and input voltage ranges. The output is regulated at 5.0 V or 3.3 V and is rated to 450 mA of output current. It also provides a number of features, including overcurrent protection, overtemperature protection and a programmable microprocessor reset. The NCV4275C is available in the DPAK and D^2PAK surface mount packages. The output is stable over a wide output capacitance and ESR range. The NCV4275C is pin for pin compatible with NCV4275A.

Features

- 5.0 V or 3.3 V ±2% Output Voltage Options
- 450 mA Output Current
- Very Low Current Consumption
- Active Reset Output
- Reset Low Down to V_Q = 1.0 V
- 500 mV (max) Dropout Voltage
- Fault Protection
  - +45 V Peak Transient Voltage
  - −42 V Reverse Voltage
  - Short Circuit Protection
  - Thermal Overload Protection
- AEC−Q100 Qualified and PPAP Capable
- These are Pb−Free Devices

Applications

- Auto Body Electronics

PIN FUNCTION DESCRIPTION

Pin No. DPAK−5 D2PAK−5	Symbol	Description
1	I	Input; Battery Supply Input Voltage. Bypass to ground with a ceramic capacitor.
2	RO	Reset Output; Open Collector Active Reset (accurate when I > 1.0 V).
3, TAB	GND	Ground; Pin 3 internally connected to tab.
4	D	Reset Delay; timing capacitor to GND for Reset Delay function.
5	Q	Output; ±2.0%, 450 mA output. Bypass with 22 μF capacitor, ESR < 4.5 Ω (5.0 V Version), 3.5 Ω (3.3 V Version).

MAXIMUM RATINGS

Rating	Symbol	Min	Max	Unit
Input Voltage	V_I	−42	45	V
Input Peak Transient Voltage	V_I	−	45	V
Output Voltage	V_Q	−1.0	16	V
Reset Output Voltage	V_{RO}	−0.3	25	V
Reset Output Current	I_{RO}	−5.0	5.0	mA
Reset Delay Voltage	V_D	−0.3	7.0	V
Reset Delay Current	I_D	−2.0	2.0	mA
ESD Susceptibility (Note 1) − Human Body Model − Machine Model − Charge Device Model	ESD_{HBM} ESD_{MM} ESD_{CDM}	4.0 200 1000	− − −	kV V V
Junction Temperature	T_J	−40	150	°C
Storage Temperature	T_{stg}	−55	150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. This device incorporates ESD protection and is tested by the followign methods: ESD Human Body Model tested per AEC−Q100−002, ESD Machine Model tested per AEC−Q100−003, ESD Charged Device Model tested per AEC−Q100−011, Latch−up tested per AEC−Q100−004.

OPERATING RANGE

Rating	Symbol	Min	Max	Unit
Input Voltage Operating Range, 5.0 V Output	V_I	5.5	42	V
Input Voltage Operating Range, 3.3 V Output	V_I	4.4	42	V
Junction Temperature	T_J	−40	150	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

LEAD TEMPERATURE SOLDERING REFLOW AND MSL (Note 2)

Rating	Symbol	Min	Max	Unit
Lead Free, 60 sec−150 sec above 217°C	T_{SLD}	−	265 Peak	°C
Moisture Sensitivity Level	MSL	1

APPLICATION INFORMATION

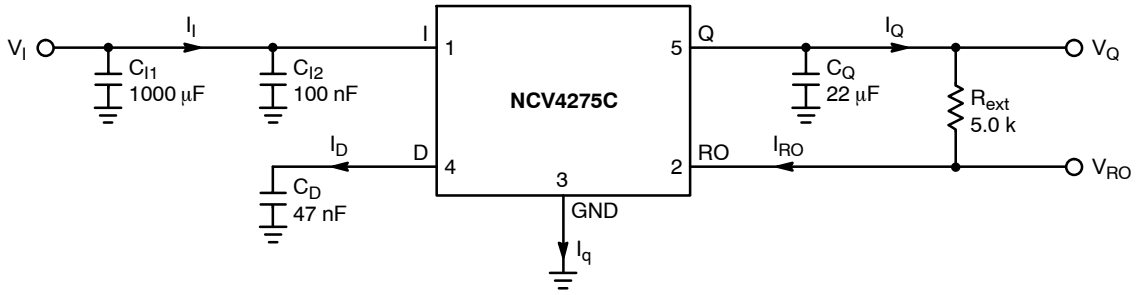

Figure 21. Test Circuit

Circuit Description

The NCV4275C is an integrated low dropout regulator that provides 5.0 V or 3.3 V, 450 mA protected output and a signal for power on reset. The regulation is provided by a PNP pass transistor controlled by an error amplifier with a bandgap reference, which gives it the lowest possible drop out voltage and best possible temperature stability. The output current capability is 450 mA, and the base drive quiescent current is controlled to prevent over saturation when the input voltage is low or when the output is overloaded. The regulator is protected by both current limit and thermal shutdown. Thermal shutdown occurs above 150°C to protect the IC during overloads and extreme ambient temperatures. The delay time for the reset output is adjustable by selection of the timing capacitor. See Figure 21, Test Circuit, for circuit element nomenclature illustration.

Regulator

The error amplifier compares the reference voltage to a sample of the output voltage (V_Q) and drives the base of a PNP series pass transistor by a buffer. The reference is a bandgap design to give it a temperature−stable output. Saturation control of the PNP is a function of the load current and input voltage. Over saturation of the output power device is prevented, and quiescent current in the ground pin is minimized.

Regulator Stability Considerations

The input capacitors (C_{I1} and C_{I2}) are necessary to stabilize the input impedance to avoid voltage line influences. Using a resistor of approximately 1.0 Ω in series with C_{I2} can stop potential oscillations caused by stray inductance and capacitance.

The output capacitor helps determine three main characteristics of a linear regulator: startup delay, load transient response and loop stability. The capacitor value and type should be based on cost, availability, size and temperature constraints. A tantalum, aluminum or ceramic capacitors can be used. The range of stability versus capacitance, load current and capacitive ESR is illustrated in Figures 2 to 5. Minimum ESR for C_Q = 22 μF is native ESR of ceramic capacitors. The aluminum electrolytic capacitor is the least expensive solution, but, if the circuit operates at low temperatures (−25°C to −40°C), both the capacitance and ESR of the capacitor will vary considerably. The capacitor manufacturer's data sheet usually provides this information.

The value for the output capacitor C_Q shown in Figure 21, Test Circuit, should work for most applications; however, it is not necessarily the optimized solution. Stability is guaranteed for $C_Q \geq 22$ μF and an ESR ≤ 4.5 Ω (5.0 V Version), 3.5 Ω (3.3 V Version). ESR characteristics were measured with ceramic capacitors and additional resistors to emulate ESR. Murata ceramic capacitors were used, GRM32ER71A226ME20 (22 μF, 10 V, X7R, 1210), GRM31MR71E105KA01 (1 μF, 25 V, X7R, 1206).

Reset Output

The reset output is used as the power on indicator to the microcontroller. This signal indicates when the output voltage is suitable for reliable operation of the controller. It pulls low when the output is not considered to be ready. RO is pulled up to V_Q by an external resistor, typically 5.0 kΩ in value. The input and output conditions that control the Reset Output and the relative timing are illustrated in Figure 22, Reset Timing.

Output voltage regulation must be maintained for the delay time before the reset output signals a valid condition. The delay for the reset output is defined as the amount of time it takes the timing capacitor on the delay pin to charge from a residual voltage of 0.0 V to the upper timing threshold voltage V_{DU}. The charging current for this is $I_{D,C}$ and D pin voltage in steady state is typically 2.4 V. By using typical IC parameters with a 47 nF capacitor on the D pin, the following time delay for 5.0 V regulator is derived:

$t_{RD} = C_D V_{DU} / I_{D,C}$

t_{RD} = 47 nF (1.8 V) / 5.5 μA = 15.4 ms

Other time delays can be obtained by changing the capacitor value.

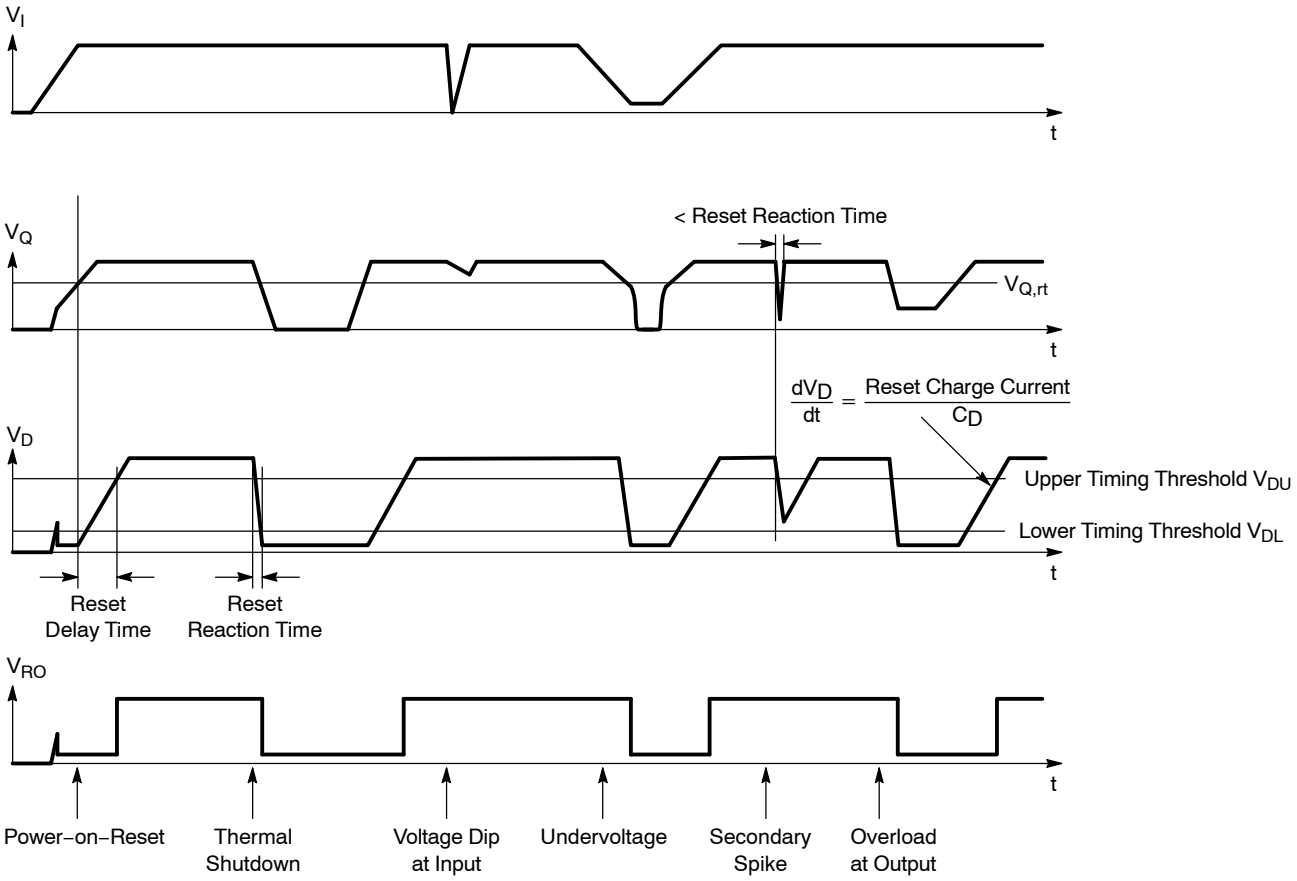

Figure 22. Reset Timing

Calculating Power Dissipation in a Single Output Linear Regulator

The maximum power dissipation for a single output regulator (Figure 23) is:

$$P_{D(max)} = [V_{I(max)} - V_{Q(min)}]I_{Q(max)} + V_{I(max)}I_q \quad (1)$$

where

$V_{I(max)}$ is the maximum input voltage,

$V_{Q(min)}$ is the minimum output voltage,

$I_{Q(max)}$ is the maximum output current for the application,

I_q is the quiescent current the regulator consumes at $I_{Q(max)}$.

Once the value of $P_{D(max)}$ is known, the maximum permissible value of $R_{\theta JA}$ can be calculated:

$$R_{\theta JA} = \frac{150^\circ C - T_A}{P_D} \quad (2)$$

The value of $R_{\theta JA}$ can then be compared with those in the package section of the data sheet. Those packages with $R_{\theta JA}$'s less than the calculated value in Equation 2 will keep the die temperature below 150°C.

In some cases, none of the packages will be sufficient to dissipate the heat generated by the IC, and an external heatsink will be required.

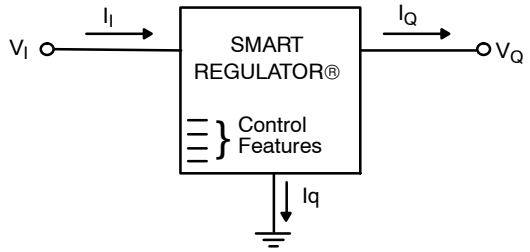

Figure 23. Single Output Regulator with Key Performance Parameters Labeled

Heatsinks

A heatsink effectively increases the surface area of the package to improve the flow of heat away from the IC and into the surrounding air.

Each material in the heat flow path between the IC and the outside environment will have a thermal resistance. Like series electrical resistances, these resistances are summed to determine the value of $R_{\theta JA}$:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CS} + R_{\theta SA} \quad (3)$$

where

$R_{\theta JC}$ is the junction−to−case thermal resistance,

$R_{\theta CS}$ is the case−to−heatsink thermal resistance,

$R_{\theta SA}$ is the heatsink−to−ambient thermal resistance.

$R_{\theta JC}$ appears in the package section of the data sheet. Like $R_{\theta JA}$, it too is a function of package type. $R_{\theta CS}$ and $R_{\theta SA}$ are functions of the package type, heatsink and the interface between them. These values appear in heatsink data sheets of heatsink manufacturers.

Thermal, mounting, and heatsinking considerations are discussed in the ON Semiconductor application note AN1040/D.
