

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# NCV887801 Start-Stop Demo

## Demonstration Note for NCV887801 Automotive Grade High-Frequency Start-Stop Boost Controller

ON Semiconductor®

<http://onsemi.com>

### Description

This NCV887801 demonstration board provides a convenient way to evaluate a high frequency boost controller designed to supply a minimum output voltage during Start-Stop vehicle battery voltage sags. The unit is in low  $I_q$  sleep-mode under normal battery operating condition and wakes-up when the monitored voltage drops below 7.3 V and begin regulating once 6.8 V is reached. Switching frequency is 450 kHz. The demo board is rated 6.8 V/3.6 A at a 2.6 V input voltage. Operation below 2.6 V is possible if output current is reduced.

### Key Features

- Automatic enable below 7.3V
- Disable Override Function
- Status Indicator
- Boost Operation at 6.8V
- 450kHz Switching Frequency
- Input Undervoltage Lockout
- Wide Input Voltage of 2.6V to 45V
- Low Quiescent Current in Sleep Mode (<12 $\mu$ A Typical)
- Cycle-by-Cycle Current Limit Protection
- Automotive Grade

Figure 1. NCV887801 Start-Stop Demo Board

## Demonstration Board Terminals

Terminal	Function
VIN (connector jack)	Positive DC input voltage (power)
GND (connector jack)	Common DC return (power)
VOUT (connector jack)	Regulated DC output voltage (power)
GND (small post)	Common DC return, monitoring point
VC (small post)	Voltage compensation, monitoring point
VOUT (small post)	Regulated DC output voltage, monitoring point
VDRV (small post)	Driving voltage, monitoring point
DISB (small post)	Disable override input, monitoring point
STAT (small post)	Status indicator, monitoring point
ISNS (small post)	Current sense resistor voltage, monitoring point
VG (small post)	MOSFET gate voltage, monitoring point
SW (small post)	MOSFET drain voltage, monitoring point

## Absolute Maximum Ratings

(Voltages are with respect to GND)

Rating	Value	Unit
DC supply voltage (VIN)	-0.3 to 45	V
DC voltage (VC, ISNS)	-0.3 to 3.6	V
DC Voltage (DISB, STAT)	-0.3 to 6	V
Junction Temperature	-40 to 150	°C
Ambient temperature (Demo Board)	-40 to 105	°C

## Electrical Characteristics

( $T_A = 25^\circ\text{C}$ ,  $2.6\text{V} \leq V_{IN} \leq V_{out}$ ,  $V_{DISB} = 5\text{V}$ , unless otherwise specified)

Characteristics	Conditions	Typical Value	Unit
-----------------	------------	---------------	------

### Switching

Switching Frequency	ROSC = 10.7k $\Omega$	450	kHz
---------------------	-----------------------	-----	-----

### Current Limit

Cycle-by-cycle Current Limit (FET)	-	18	A
------------------------------------	---	----	---

### Protections

Maximum Duty Cycle	-	0.83	-
VOUT Undervoltage Lockout (UVLO)	VOUT falling	3.59	V
Thermal Shutdown	$T_A$ increasing	170	°C

## Operational Guidelines

The demo board is rated to operate under full load for input voltage as low as 2.6V at the input terminal under full power (less if output current is reduced). Start-Stop applications use reverse battery protection diodes in front of the boost converter (Fig. 2), so the input source can operate down to 2.6V plus a diode drop (i.e. ~3V).

### Notes:

- a. The IC UVLO (undervoltage lockout) is 4.05V for VOUT rising, 3.59V for VOUT falling (0.54V hysteresis).
- b. Limit time spent with the power supply operating at minimum input voltage (equivalent to  $V_{IN} = 2.6V$ ) to avoid overheating the power semiconductors.

### First Time Power-Up:

1. Connect a DC source voltage (15A capable) set to a voltage of 12-13V as shown in Fig. 1.
2. Connect the DISB TTL control signal as shown in Fig. 1. The initial DISB state should be set to logic-'0'.
3. Connect a 3.6A constant current load on the output.
4. Decrease the DC input voltage until the PCB VIN voltage is  $5.5V \pm 0.5V$ .
5. Set the DISB control signal to a TTL high state (i.e. 5V).
6. Verify that the unit is regulating at  $V_{OUT} = 6.8V$ .
7. Reduce the DC input voltage until the PCB VIN = 2.6V. Verify that the unit is regulating at  $V_{OUT} = 6.8V$ .

### Start-Stop Voltage Transient Test:

1. Connect both DC1 and DC2 input power supplies as illustrated in Fig. 2. Adjust DC2 so that PCB VIN = 2.6V for a 3.6A load.
2. Connect a 3.6A load on the output. If a load resistor is used, it is recommended to start from a DC1 input voltage of 8.5-9.0V to avoid overstressing the PCB boost diode (D1, rated 4A).
3. Monitor VOUT. Disconnect supply DC1. VOUT should have a response similar to that of Fig 3.

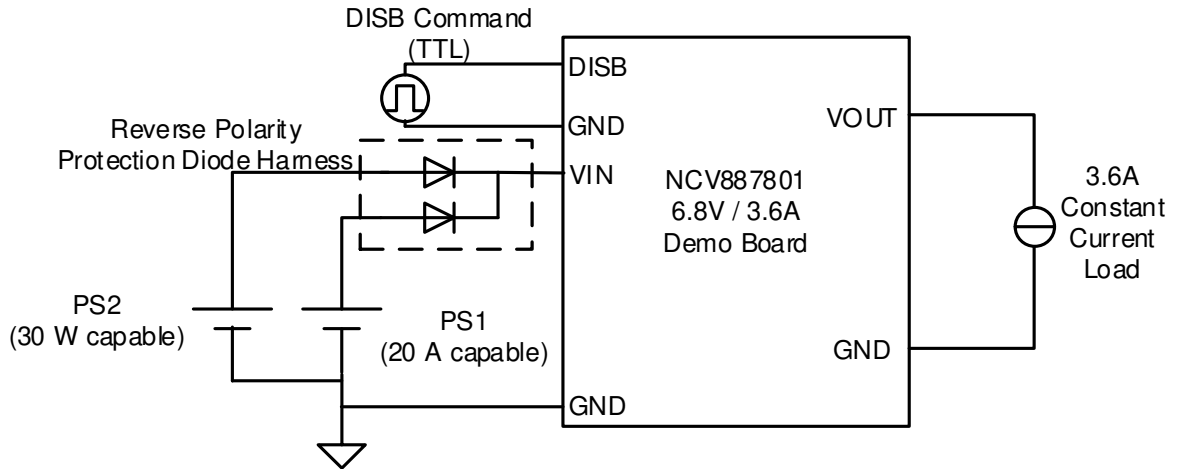

Figure 2. Demo Board Connections

## Typical Performance

### DC1 is disabled, then re-enabled

Figure 3 NCV887801 Demo Board Waveforms

- DC2 at VIN adjusted to 2.6V (after reverse polarity protection diode)
- VOUT = 6.8V, I<sub>OUT</sub> = 3.6A
