

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Circuit Description

The NE5550979A-EV09-A is an evaluation circuit board for Renesas' power LDMOS FET, NE5550979A optimized for the performance at 915MHz. The circuit board is RoHS compliant.

### Matching and Bias Circuits

Both input and output matching networks consist of shunt capacitors and sections of transmission lines (refer to the schematic and assembly drawing on the last page of this document for the component designation). The input matching is tuned for good input return loss while the output matching is for high saturation power. The electrical lengths of the transmission lines labeled on the schematic are estimated and for reference only. Some bench tuning on the actual circuit board is usually required to achieve the optimal performance. The PCB used is a CEL's standard circuit board for power device of 79A package. The lengths of traces labeled TL1 and TL7 are not critical and can be shortened. So the actual circuit size for a 900MHz application can be smaller than that of this evaluation circuit board.

LDMOSFETs essentially draw no gate current under normal operation conditions. Therefore a large value resistor, in the order of  $k\Omega$ , can be used for the bias at gate so that the RF path is completely isolated from the DC line. At the drain an inductor is used as the RF choke. The current rating for this inductor should be high enough to provide the required current at the operation conditions.

### Bias Conditions

This evaluation board was optimized at a specific drain voltage, 7.5V. For different supply voltages, the matching circuits should be adjusted to fully utilize the device capability. The quiescent current is 200mA for the data shown below. The gain is higher at higher quiescent currents, particularly when the device is not completely saturated. For many communication systems, where the PA is never at idle state, a high quiescent current might be used.

### PCB Material:

The PCB is Getek 28mil two layer board. The dielectric constant of Getek is 4.2.

# Typical Performance Data

Test Conditions:

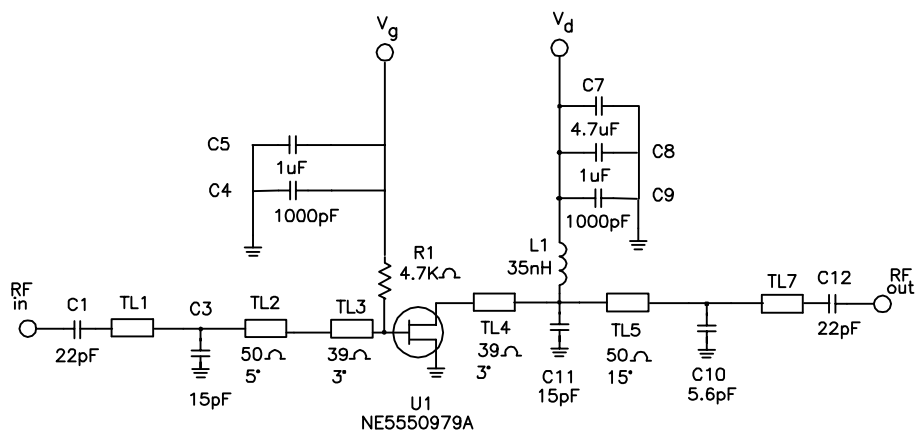

$f=915\text{MHz}$

$V_d=7.5\text{V}$ ,  $I_{dsq}=200\text{mA}$

$P_{out}$ , Gain, PAE and Current vs  $P_{in}$  are shown in the following plot.
