

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

NET+50 Data Sheet

The Digi **NET+50** is a high-performance, highly integrated, 32-bit, system-on-a-chip ASIC, designed for use in intelligent networked devices and Internet appliances. The NET+50 is based on the standard architecture in the NET+ARM™ family of devices.

To support a variety of networking scenarios, the NET+50 includes a 10/100 BaseT Ethernet MAC with MII interface and two independent serial ports, each of which can run in UART, HDLC, or SPI mode.

The NET+50 CPU is an ARM7TDMI 32-bit RISC processor with a rich complement of support peripherals and memory controllers for various types of memory (including flash, SDRAM, EEPROM, and others), programmable timers, a 10-channel DMA controller, a P1284/ENI interface, an external bus expansion module, and up to 40 general-purpose I/O pins and 16 general-purpose input pins.

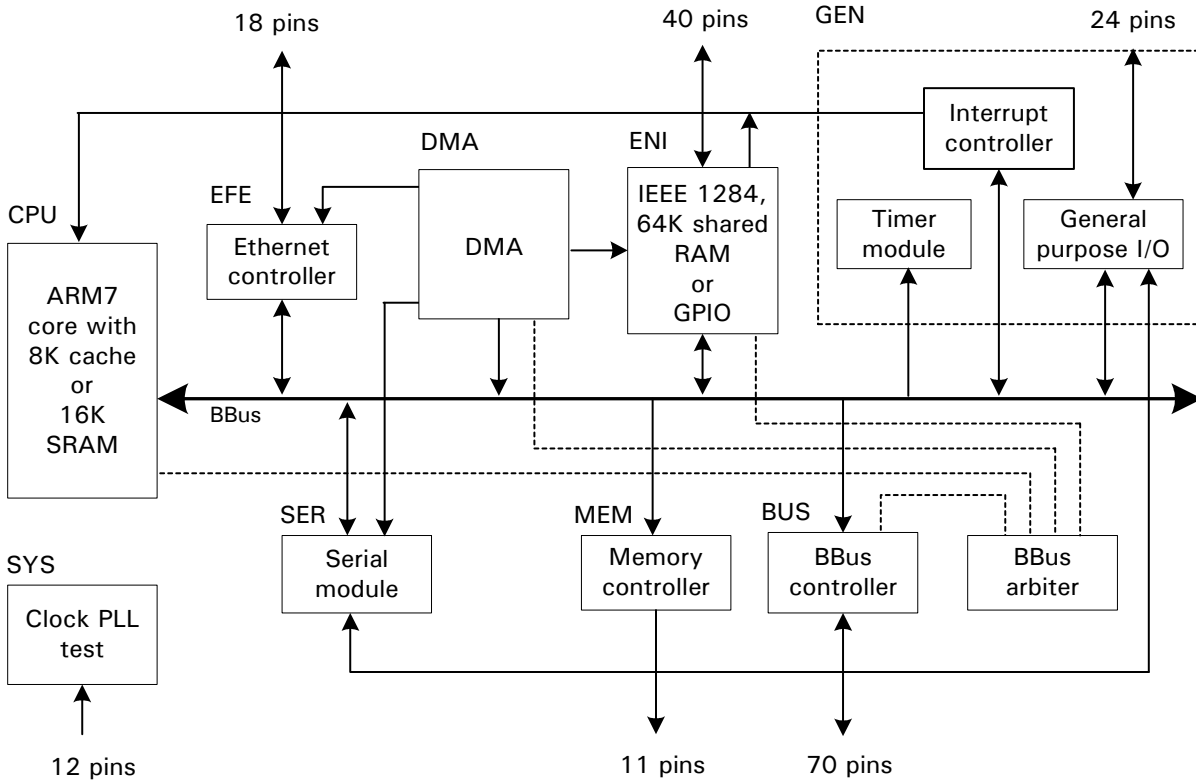

NET+ARM is the hardware foundation for the **NET+Works™** family of integrated hardware and software solutions for device networking. The NET+Works solution includes drivers, operating systems, networking software, development tools, APIs, and complete development boards.

NET + 50 block diagram

The following diagram provides an overview of the modules that make up the NET+50 device:

Key features

CPU core

- Full 32-bit ARM7TDMI RISC processor
- 32-bit internal bus
- 16-bit Thumb mode
- 8 KB cache, configurable as 16 KB RAM
- 15 general-purpose 32-bit registers
- 32-bit program counter and status register
- Five supervisor modes, one user mode

Integrated 10/100 Ethernet MAC

- 10/100 MII-based PHY interface
- 10 Mbit ENDEC interface
- Supports TP-PMD and fiber-PMD devices
- Full-duplex and half-duplex modes
- Optional 4B/5B coding
- Full statistics gathering (SNMP and RMON)
- Station, broadcast, and multicast address detection and filtering
- 128-byte transmit FIFO, 2 KB receive FIFO
- Intelligent receive-side buffer selection

Operating frequency

- 44-MHz maximum system clock, requiring only a simple external 18.432-MHz crystal
- Supports external oscillators

ENI/P1284 Interface

- ENI host interface
- Four IEEE 1284 parallel ports
- 64 KB shared RAM ENI interface — 8- or 16-bit
- Full-duplex FIFO mode interface — 8- or 16-bit
- 32-byte transmit/receive FIFO mode FIFOs

Programmable timers

- Two independent, 27-bit timers (2 μ s–20.7 hours)
- Watchdog timer (interrupt or reset on expiration)
- Bus timer

Serial port

- Two fully independent serial ports (UART, HDLC, SPI)
- Digital phase locked loop (DPLL) for receive clock extractions
- 32 byte transmit/receive FIFOs
- Internal programmable bit-rate generators
- Bit rates 75–230400 in 16X mode, 1200 bps – 4 Mbps in 1X mode. (Higher rates may be possible depending on the board design.)

10-channel DMA controller

- Two channels dedicated to Ethernet transmit and receive
- Four channels dedicated to serial transmit and receive
- Four channels (two at a time) configurable for external peripherals
- Flexible buffer management

Bus interface

- Five independent, programmable chip selects with 256 Mb addressing per chip select
- All chip selects support SRAM, EDO DRAM, SDRAM, and devices such as flash and EEPROM with SRAM interfaces
- Supports 8-, 16-, and 32-bit peripherals
- Dynamic bus sizing support
- Supports ASYNC and SYNC peripheral timing
- Internal DRAM address multiplexing
- Internal refresh controller (CAS before RAS)
- Burst-mode support
- 0–15 wait states per chip select
- Bootstrap support

Power and operating voltages

- 552 mW maximum (typically, 484 mW), outputs switching
- 3.3 V — I/O
- 2.5 V — core

Serial port (cont)

- Odd, even, or no parity
- 5, 6, 7, or 8 bits
- 1 or 2 stop bits
- Internal and external clock support
- Receive-side character and buffer gap timers
- Four receive-side data match detectors

Packaging dimensions and pinout

The NET+50 is available in two package options – a ball-grid array (BGA) or a plastic quad flat pack (PQFP).

BGA packaging and pinout diagram

PQFP packaging and pinout diagrams

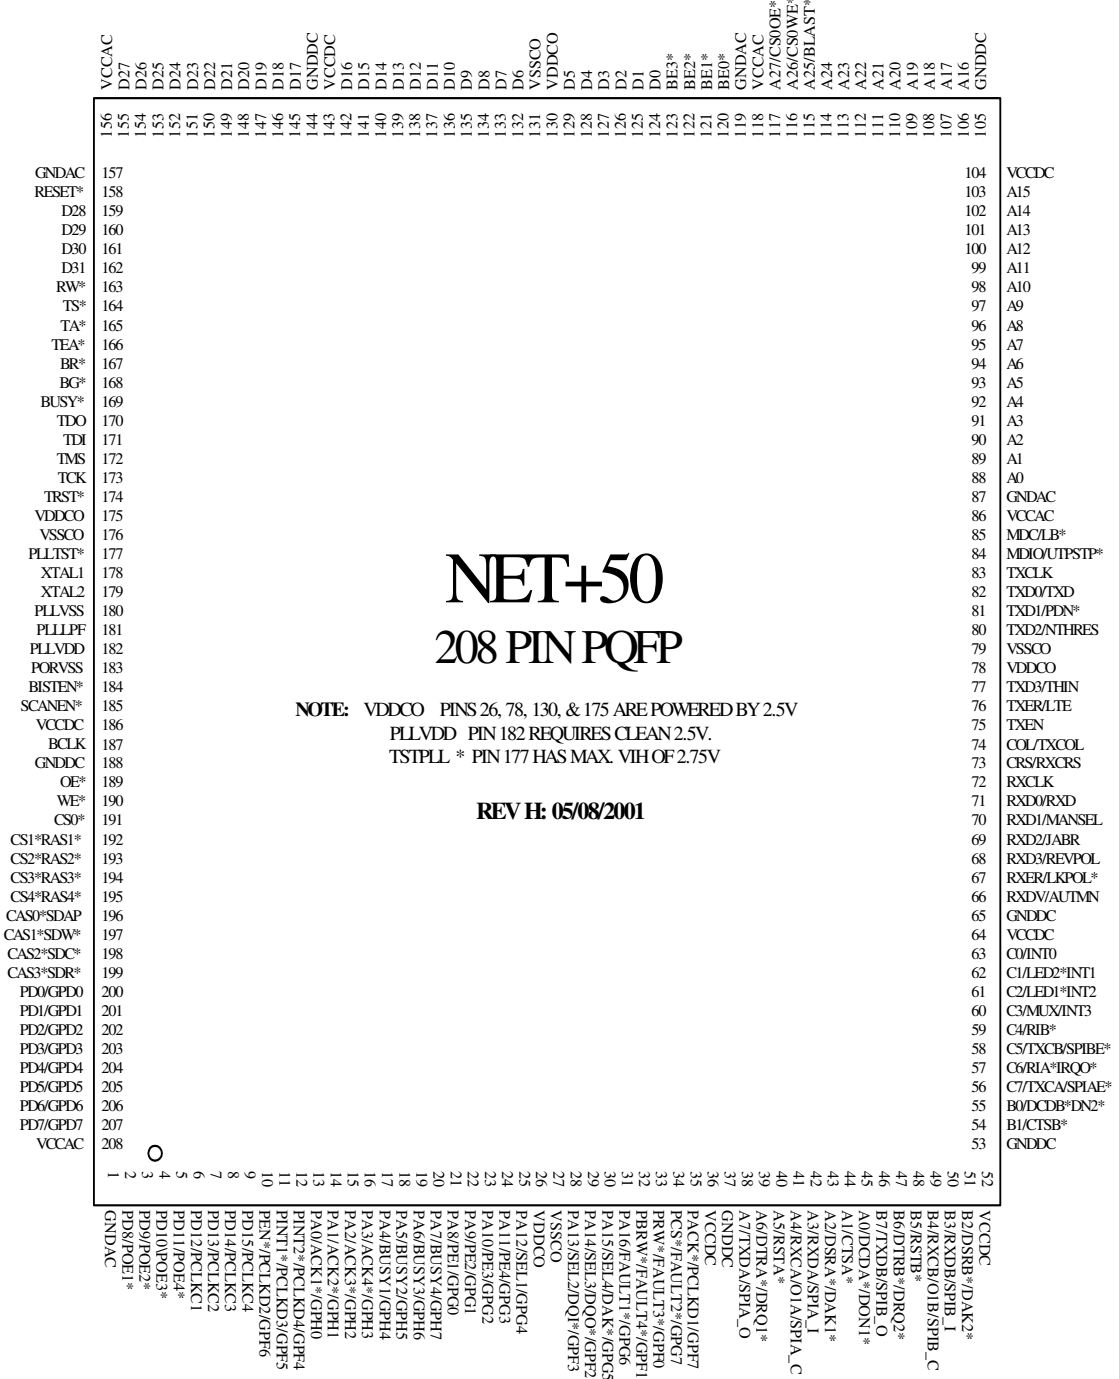

PQFP packaging

PQFP pinout

Pinout detail tables

The pinout tables in the following sections have the following columns:

Signal	The pin name for each I/O signal. Some signals have dual modes and are identified accordingly. The mode is configured through firmware using a configuration register. Some modes may require hardware configuration during a RESET condition
BGA	The BGA pin number for specific I/O signals.
PQFP	The PQFP pin number for specific I/O signals.
†	A dagger indicates a pin that is an input current source. (The daggers appear in the BGA column, but this applies in PQFP layout as well.)
*	An asterisk indicates a pin that is <i>active low</i> .
I/O	The type of signal — input, output, or input/output (I/O).
OD	The output drive strength of an output buffer. The NET + 50 uses one of three drivers: <ul style="list-style-type: none"> ■ 2 mA ■ 4 mA ■ 8 mA

Power supply

Signal	BGA	PQFP	Description
V _{CC} DC 3.3 V DC	F15, B17, C12, A2, M2, U9	36, 52, 64, 104, 143, 186	I/O steady state (6 pairs)
V _{SS} DC Gnd Returns	F14, A17, D12, A1, N3, U10	37, 53, 65, 105, 144, 188	
V _{CC} AC 3.3 V	A8, E1, T1, U16	86, 118, 156, 208	I/O switching (4 pairs — see note below on 3.3 V power and GND pads)
V _{SS} AC Gnd Return	B7, F2, U1, U17	87, 119, 157, 1	
V _{DD} CO 2.5 V	K17, A10, H1, T7	26, 78, 130, 175	Core power (4 pairs)
V _{SS} CO Gnd Returns	J16, B9, J2, U6	27, 79, 131, 176	
PLL V _{DD} 2.5 V	U8	182	PLL bead filtered clean power
PLL V _{SS} Gnd Return	R9	180	Power-up reset ground reference
POR V _{SS} Gnd	T9	183	

Additional information about NET + 50 pins

- All outputs drive TTL levels. Outputs drive to 0.4 V maximum on low, 2.4 V minimum on high.
- The following pins require a 2.5 V input level:

Signal	BGA	PQFP
XTAL1	U7	178
PLLTST	P8	177
PLLVDD	U8	182

- TRST* (R8, 174) is the only pin that is an input current sink.
- Remaining inputs are TTL levels and are 3.3 V tolerant, allowing integration with 3.3 V devices.
- Regarding 3.3 V power and GND pads: In general, you should use separate power pairs for AC and DC power to prevent the noise in the AC power buses from reaching the DC power buses. Digi recommends (and uses) a ferrite bead to filter the AC power pins.

Registers and addresses

General control module

Address	Register	Address	Register
0xFFB0 0000	System control register	0xFFB0 0024	Port B register

0xFFB0 0020	Port A register	0xFFB0 0044	Cache control register 1

Memory module controller

Address	Register	Address	Register
0xFFC0 0000	Memory module configuration register (MMCR)	0xFFC0 0034	Chip select 2 option register (OR2)
0xFFC0 0010	Chip select 0 base address register (BAR0)	0xFFC0 0038	Chip select 2 option register B (OR2B)
0xFFC0 0014	Chip select 0 option register (OR0)	0xFFC0 0040	Chip select 3 base address register (BAR3)
0xFFC0 0018	Chip select 0 option register B (OR0B)	0xFFC0 0044	Chip select 3 option register (OR3)
0xFFC0 0020	Chip select 1 base address register (BAR1)	0xFFC0 0048	Chip select 3 option register B (OR3B)
0xFFC0 0024	Chip select 1 option register (OR1)	0xFFC0 0050	Chip select 4 base address register (BAR4)
0xFFC0 0028	Chip select 1 option register B (OR1B)	0xFFC0 0054	Chip select 4 option register (OR4)
0xFFC0 0030	Chip select 2 base address register (BAR2)	0xFFC0 0058	Chip select 4 option register B (OR4B)

DMA controller module

DMA register key: $0xFF90nnnn$ where $nnnn = DMAx + Offset$

DMAx:						Offset:	
1A:	00	2:	80	6:	100	00	Buffer descriptor pointer
1B:	20	3:	A0	7:	120	10	Buffer control register
1C:	40	4:	C0	8:	140	14	Buffer status register
1D:	60	5:	E0	9:	160		
				10:	180		

Examples:

0xFF90 0000	DMA 1A buffer descriptor pointer
0xFF90 0010	DMA 1A buffer control register
0xFF90 0014	DMA 1A buffer status register

Ethernet controller module

Address	Register	Address	Register
0xFF80 0000	General control register	0xFF80 0440 – 0478	Transmit control registers
0xFF80 0004	General status register	0xFF80 0480 – 0488	Receive control registers
0xFF80 0008	FIFO data register	0xFF80 040C0	Link fail counter
0xFF80 000C	FIFO last word data register	0xFFB0 0500	10 Mbit jabber counter
0xFF80 0010	TX status register	0xFFB0 0504	10 Mbit loss of carrier counter
0xFF80 0014	RX status register	0xFFB0 0540 – 0550	MII control registers
0xFF80 0400 – 0404	MAC configuration and test registers	0xFFB0 0580 – 059C	Status registers
0xFF80 0408 – 040C	PCS configuration and test registers	0xFFB0 05C0	SAL address filter register
0xFF80 0410 – 0414	STL configuration and test registers	0xFFB0 05C4 – 05DC	SAL hash table registers

Serial controller module

Address	Register	Address	Register
0xFFD0 0000 – 0030	Channel 1 registers	0xFFD0 0040 – 0070	Channel 2 registers

ENI controller module

Address	Register	Address	Register
0xFFA0 0000	General control register	0xFFA0 0030	ENI control register
0xFFA0 0004	General status register	0xFFA0 0034	ENI pulsed interrupt register
0xFFA0 0008	FIFO mode data register	0xFFA0 0038	ENI shared RAM address register
0xFFA0 0010 – 001C	IEEE1284 ports 1–4 control registers	0xFFA0 003C	ENI shared register
0xFFA0 0020 – 002C	IEEE 1284 ports 1–4 data registers	0xFFA0 0040 – 0050	GPIO ports D, F, G, H, and F registers

Test modes and PLL usage

The PLLTST*, BISTEN*, and SCANEN* primary inputs control test modes for test operations (in manufacturing) and for using an external oscillator instead of a crystal, as follows:

PLLTST *	BISTEN *	SCANEN *	Mode
1	1	1	Normal with PLL operational
0	1	1	Normal with PLL bypass
1	1	0	HiZ / Tri-state (manufacturing testing)

Note: All other combinations of these inputs are reserved.

PLL

When the PLLTST* signal is active low, the PLL is isolated, and the internal system clock is provided by the XTAL1 input (XTAL1 = SYSCLK). The PLL is not programmable. If you want to use the PLL (crystal) and get a system clock of 44.236 MHz, you must use an 18.432 MHz crystal.

HiZ/Tri-state

The NET+50 chip supports a way to tri-state all outputs. When both PLLTST* and BISTEN* are inactive (high) and SCANEN* is active (low), all outputs are placed in a low current tri-state mode.

ARM debugging features

The ARM7TDMI core contains hardware extensions for advanced debugging. These extensions facilitate development and testing of application software, operating systems, and the hardware itself.

The debug extensions let you stop the core on a given instruction fetch (break-point) or data access (watchpoint), or asynchronously by a debug request. In such cases, the ARM processor is in *debug state* so you can examine the core's internal state and the system's external state. When the examination is complete, you can restore the core and system state, and resume program execution.

The ARM processor is put into debug state by an internal functional unit called *ICEBreaker*. In debug state, the core isolates itself from the memory system. You can examine the core while all other system activities – for example, DMA operations – continue normally.

You can examine the ARM processor's internal state through the 5-pin interface for debugging. This interface lets you serially insert instructions into the core's pipe-line without using the external data bus. Therefore, in debug state, you can insert a store-multiple into the instruction pipeline to dump the contents of the processor's registers. Data can be serially shifted out without affecting the rest of the system.

DC characteristics and other specifications

DC inputs

Symbol	Characteristic	Conditions	Min.	Typical	Max.	Unit
V_{DD}	DC supply voltage – core		2.25	2.5	2.75	V
V_{CC}	DC supply voltage – I/O		3.0	3.3	3.6	V
V_{IH}	Input high voltage		2.0		3.6	V
V_{IL}	Input low voltage		$V_{SS} - 0.3$		0.8	V
I_{IL}	Input buffer	$V_{IN} = V_{CC}$	-10		10	μA
	Input buffer with current sink		99		429	
I_{IH}	Input buffer	$V_{IN} = V_{SS}$	-10		10	μA
	Input buffer with current source		130		352	
C_{IN}	Input capacitance	Any input	7			pF
V_T	Switching threshold	Any input	1.4	2.0		V

DC outputs

Symbol	Characteristic	Conditions	Min.	Max.	Unit
V_{OL}	Output low voltage		0	0.4	V
V_{OH}	Output high voltage		2.4	V_{CC}	V
I_{OZ}	High-Z leakage current	$V_O = V_{SS}$	-10	10	μA
I_{OS}	Output short circuit current	$V_{CC} = 3.6V, V_O (\text{low}) = V_{CC}$		55	μA
		$V_{CC} = 3.6V, V_O (\text{high}) = V_{SS}$	-55		
C_{IO}	Input/output capacitance	Any input, output, or I/O		7	pF

DC absolute maximum voltages

Characteristic	Min.	Max.
Supply voltage 2.5 V – core	-0.3	3.15
Supply voltage 3.3 V – I/O	-0.3	4.00
Input voltage	-0.3	4.50
Output voltage	-0.3	4.50

Temperature considerations

Characteristic	Min.	Max.
Thermal resistance – junction to ambient	37°C/W	
Operating junction temperature (°C)	-40°	100°
Operating ambient temperature (°C)	-40°	85°
Storage temperature (°C)	-60°	150°

Timing data and diagrams

Reset timing

Number	Characteristic	Min.	Max.	Unit
7	V _{DD} at 3.0 V to RESET* high	40		ms
8	RESET* pulse width low	10/F _{SYSCLK}		μs
9	RESET* low to V _{DD} below 3.0 V	8/F _{SYSCLK}		μs

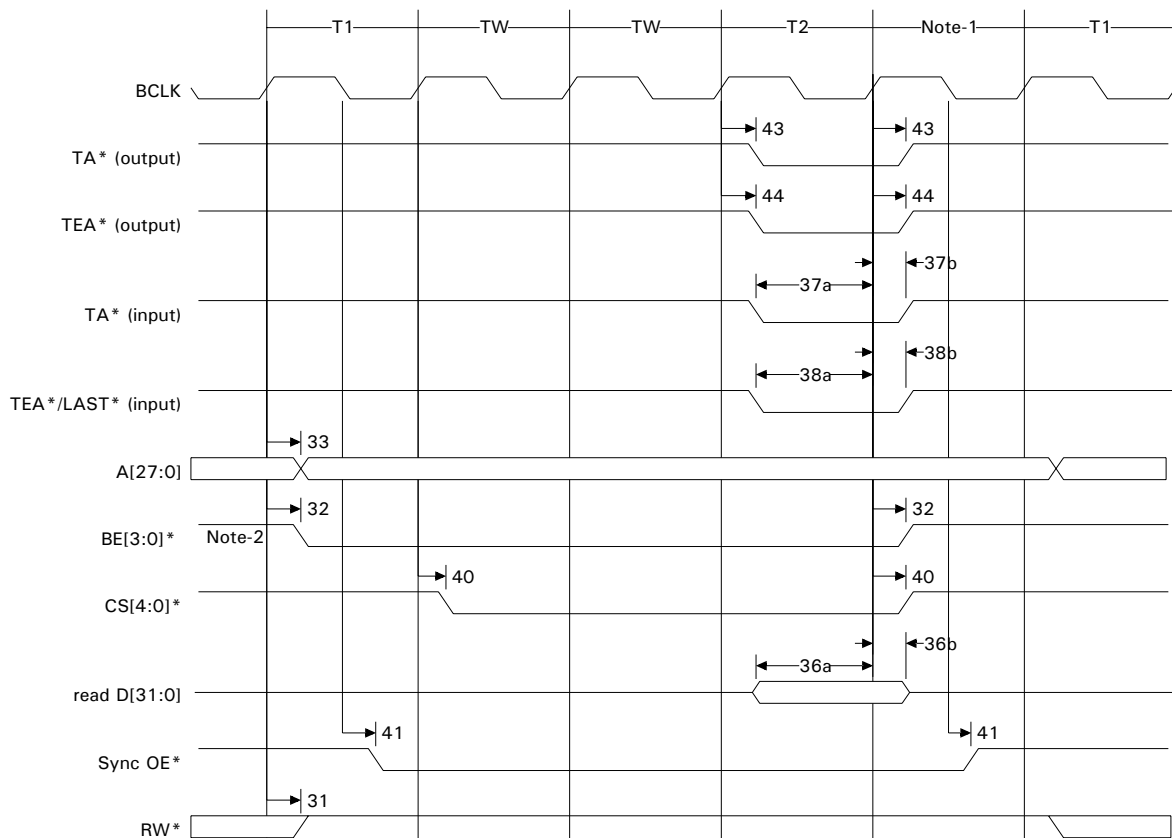

SRAM timing

Number	Characteristic	Min.	Max.
31	BCLK high to RW* valid		19
32	BCLK high to BE* valid		16
33	BCLK high to Address valid	4	15
34	BCLK high to Data Out high impedance		17
35	BCLK high to Data Out valid		18
36a	Data In valid to BCLK high (setup)	8	
36b	BCLK high to Data In invalid (hold)	0	
37a	TA* valid to BCLK high (setup)	8	
37b	BCLK high to TA* invalid (hold)	0	
38a	TEA* valid to BCLK high (setup)	8.5	
38b	BCLK high to TEA* invalid (hold)	0	
40	BCLK high to CS* valid		16
41	BCLK low to OE* valid		14
42	BCLK low to WE* valid		16
43	BCLK high to TA* valid		11
44	BCLK high to TEA* valid		14

Minimum and maximum are in nanoseconds (ns).

SRAM Sync Read (Wait = 2)

Notes:

- 1 There can be 0, 1, or 2 null periods between memory transfers. Contact the factory for details.
- 2 Port size determines which byte enable signals are active:
 - 8-bit port = BE3*
 - 16-bit port = BE[3:2]*
 - 32-bit port = BE[3:0]*
