## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## MC14585B

## 4-Bit Magnitude Comparator

The MC14585B 4-Bit Magnitude Comparator is constructed with complementary MOS (CMOS) enhancement mode devices. The circuit has eight comparing inputs (A3, B3, A2, B2, A1, B1, A0, B0), three cascading inputs $(\mathrm{A}<\mathrm{B}, \mathrm{A}=\mathrm{B}$, and $\mathrm{A}>\mathrm{B})$, and three outputs $(\mathrm{A}<\mathrm{B}$, $\mathrm{A}=\mathrm{B}$, and $\mathrm{A}>\mathrm{B}$ ). This device compares two 4-bit words ( A and B ) and determines whether they are "less than", "equal to", or "greater than" by a high level on the appropriate output. For words greater than 4 -bits, units can be cascaded by connecting outputs $(\mathrm{A}>\mathrm{B})$, $(\mathrm{A}<\mathrm{B})$, and $(\mathrm{A}=\mathrm{B})$ to the corresponding inputs of the next significant comparator. Inputs $(\mathrm{A}<\mathrm{B}),(\mathrm{A}=\mathrm{B})$, and $(\mathrm{A}>\mathrm{B})$ on the least significant (first) comparator are connected to a low, a high, and a low, respectively.

Applications include logic in CPU's, correction and/or detection of instrumentation conditions, comparator in testers, converters, and controls.

## Features

- Diode Protection on All Inputs
- Expandable
- Applicable to Binary or 8421-BCD Code
- Supply Voltage Range $=3.0 \mathrm{Vdc}$ to 18 Vdc
- Capable of Driving Two Low-Power TTL Loads or One Low-Power Schottky TTL Load over the Rated Temperature Range
- Can be Cascaded - See Figure 3
- NLV Prefix for Automotive and Other Applications Requiring

Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable*

- This Device is $\mathrm{Pb}-$ Free and is RoHS Compliant

MAXIMUM RATINGS (Voltages Referenced to $\mathrm{V}_{\text {SS }}$ )

| Parameter | Symbol | Value | Unit |
| :--- | :---: | :---: | :---: |
| DC Supply Voltage Range | $\mathrm{V}_{\mathrm{DD}}$ | -0.5 to +18.0 | V |
| Input or Output Voltage Range <br> (DC or Transient) | $\mathrm{V}_{\text {in }}, \mathrm{V}_{\text {out }}$ | -0.5 to $\mathrm{V}_{\mathrm{DD}}$ <br> +0.5 | V |
| Input or Output Current (DC or Transient) <br> per Pin | $\mathrm{I}_{\text {in }}, \mathrm{I}_{\text {out }}$ | $\pm 10$ | mA |
| Power Dissipation per Package (Note 1) | $\mathrm{P}_{\mathrm{D}}$ | 500 | mW |
| Ambient Temperature Range | $\mathrm{T}_{\mathrm{A}}$ | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $\mathrm{T}_{\mathrm{stg}}$ | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| Lead Temperature (8-Second Soldering) | $\mathrm{T}_{\mathrm{L}}$ | 260 | ${ }^{\circ} \mathrm{C}$ |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Temperature Derating: "D/DW" Package: $-7.0 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ From $65^{\circ} \mathrm{C}$ To $125^{\circ} \mathrm{C}$ This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, $\mathrm{V}_{\text {in }}$ and $\mathrm{V}_{\text {out }}$ should be constrained to the range $\mathrm{V}_{\mathrm{SS}} \leq\left(\mathrm{V}_{\text {in }}\right.$ or $\left.\mathrm{V}_{\text {out }}\right) \leq \mathrm{V}_{\mathrm{DD}}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either $\mathrm{V}_{\mathrm{SS}}$ or $\mathrm{V}_{\mathrm{DD}}$ ). Unused outputs must be left open.
