Dual QSFP+40GBase-SR4 Optical Bypass Module

O B M – D 3 Q H 2 – B 0 1

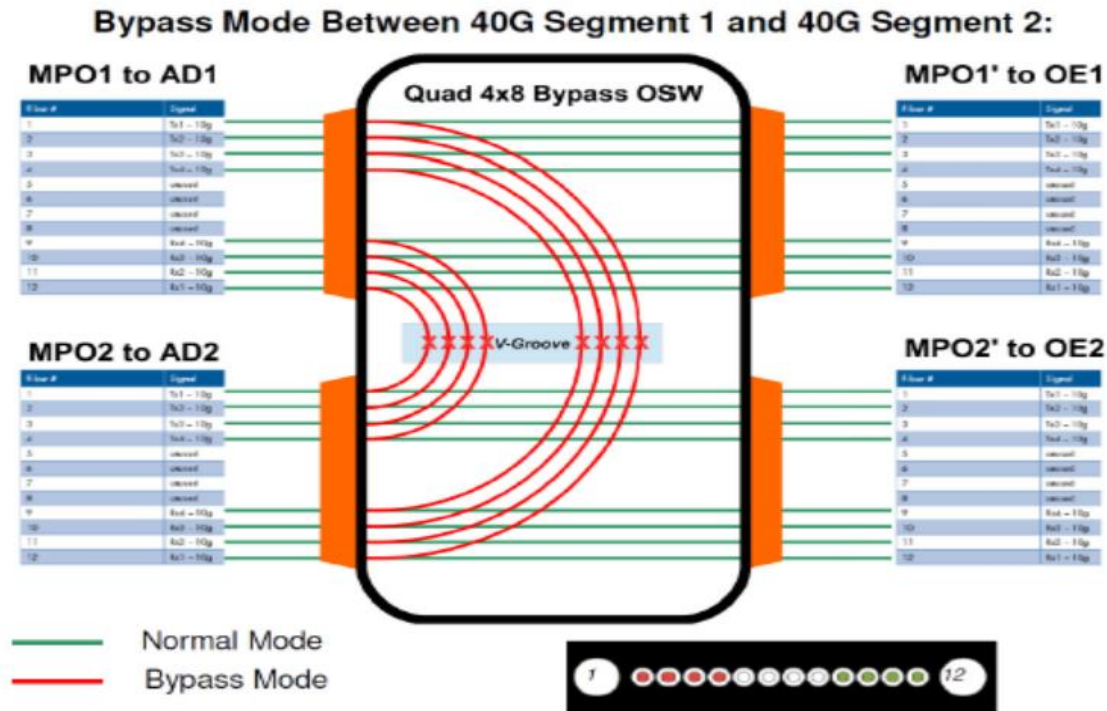

Product Overview

FormericaOE dual QSFP+,40G Base-SR4 (2*40G) Optical Bypass Module (OBM) is a compact box that contains two QSFP+,40G Base-SR4 optical transceivers and optical switches control circuit board. It can be integrated with I/O ports controllers in a Network Interface Card (NIC). The FormericaOE dual QSFP+,40G Base-SR4 OBM is targeted to inline network system that maintains network connectivity when power failure occurs or system fails, particularly for Data Centers that employ extensive QSFP+,40G Base-SR4 for optical inter connects between servers and switches. FormericaOE Dual QSFP+,40G Base-SR4 OBM supports normal and bypass modes, and can be controlled to perform the block mode. In normal mode, the ports are independent interfaces. In bypass mode, all packets received from one port are transmitted to the adjacent port. In block mode, the module blocks the route. FormericaOE Dual QSFP+,40G Base-SR4 OBM can bypass or block its I/O ports on a host system failure, power off, or upon software request. It can be integrated with any brand of CPU controller. It is suitable for connecting with in-line equipment for power failure or system maintenance. When the in-line unit is not on or is in bypass mode, the relays within the OBM are set to bridge the optical signals directly through the optical switch, completely bypassing the in-line equipment. If the in-line equipment is operating normally, then it supplies power to the switch through a high speed connector PIN. Compact and competitive cost, this module provides excellent performance on your network.

Note 1: GND is the symbol for signal and supply (power) common for the QSFP module. All are common within the QSFP+ module and all module voltages are referenced to this potential unless otherwise noted. Connect these directly to the host board signal-common ground plane.

Note 2: Vcc Rx, Vcc1 and Vcc Tx are the receiver and transmitter power supplies and shall be applied concurrently. Requirements defined for the host side of the Host Edge Card Connector are listed in Table . Recommended host board power supply filtering is shown in Figure . Vcc Rx Vcc1 and Vcc Tx may be internally connected within the QSFP+ module in any combination. The connector pins are each rated for a maximum current of 500 mA.
