Silicon Photo Darlington in PLCC-2 Package

OP580DA

Features:

- Wide acceptance angle
- High Current Gain
- Fast Response Time
- Plastic leadless chip carrier (PLCC)

Description:

The **OP580DA** is an NPN silicon phototdarlington mounted in a miniature SMD package.
This device has a flat window lens, which enables a wide acceptance angle. It is packaged in a plastic leadless chip carrier which is compatible with most automated mounting equipment. **OP580DA** are 100% production tested using infrared light for close correlation with Optek GaAs and GaAlAs emitters. Photo darlington devices are normally used in application where light signals are low and more current gain is needed than is possible with phototransistors.

***OP580DA** is mechanically and spectrally matched to the OP280 series infrared LEDs.*

Applications:

- Non-contact position sensing
- Datum detection
- Machine automation
- Optical encoders

Notes:
1. Solder time less than 5 seconds at temperature extreme.
2. Derate linearly at 1.33 mW/° C above 25° C.
3. $E_{E(APT)}$ is an unfiltered GaAs LED with a peak emission wavelength of 935 nm and a radiometric intensity level which varies less than 10% over the entire lens surface of the phototransistor being tested.
4. To calculate typical collector dark current in µA, use the formula $I_{CEO} = 10^{(0.04\ T_A\ -3/4)}$ where T_A is the ambient temperature in ° C.
