Timing-Safe™ Peak EMI Reduction IC

ON Semiconductor®

http://onsemi.com

Functional Description

P3PS850BH is a versatile, Timing−Safe peak EMI reduction IC. P3PS850BH accepts one input from an external reference, and locks on to it delivering a 1x Timing−Safe output clock. P3PS850BH has a Frequency Selection (FS) control that facilitates selecting one of the two operating frequency ranges. Refer to the *frequency Selection table.* The device has an SSEXTR pin to select different deviations depending upon the value of an external resistor connected at this pin to GND. P3PS850BH has an MR pin for selecting one of the two Modulation Rates. PD#/OE provides the Power Down option. Outputs will be tri−stated when power down is active.

P3PS850BH operates over a supply voltage range of 2.3 V to 3.6 V, and is available in an 8 Pin WDFN (2 mm x 2 mm) Package.

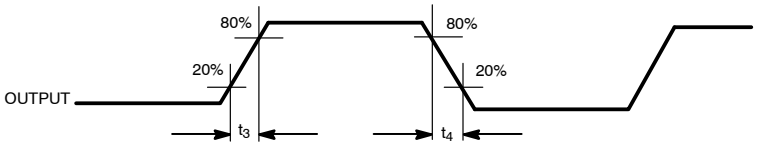

Figure 23. Output Rise/Fall Time

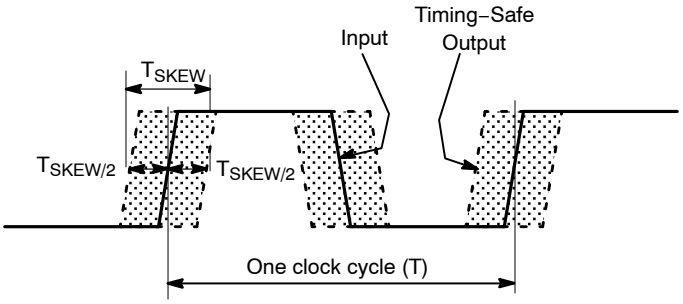

T_{SKEW} represents input−output skew when spread spectrum is ON
For example, T_{SKEW} / 2 = 0.20 * T for an Input clock of 24 MHz, translates in to (1/24 MHz) * 0.20 = 8.33 ns

PCB Layout Recommendation

For optimum device performance, following guidelines are recommended.

- Dedicated V_{DD} and GND planes.
- The device must be isolated from system power supply noise. A 0.1 μF and a 2.2 μF decoupling capacitor should be mounted on the component side of the board as close to the V_{DD} pin as possible. No vias should be used between the decoupling capacitor and V_{DD} pin. The PCB trace to V_{DD} pin and the ground via should be kept as short as possible. All the V_{DD} pins should have decoupling capacitors.
- In an optimum layout all components are on the same side of the board, minimizing vias through other signal layers.

A typical layout is shown in Figure 27.
