

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## 3.3 V Zero-Delay Buffer

### Description

ASM5P2308A is a versatile, 3.3 V zero-delay buffer designed to distribute high-speed clocks. It is available in a 16-pin package. The part has an on-chip PLL which locks to an input clock presented on the REF pin. The PLL feedback is required to be driven to FBK pin, and can be obtained from one of the outputs. The input-to-output propagation delay is guaranteed to be less than  $\pm 250$  pS, and the output-to-output skew is guaranteed to be less than 200 pS.

The ASM5P2308A has two banks of four outputs each, which can be controlled by the select inputs as shown in the *Select Input Decoding Table*. If all the output clocks are not required, Bank B can be three-stated. The select input also allows the input clock to be directly applied to the outputs for chip and system testing purposes.

Multiple ASM5P2308A devices can accept the same input clock and distribute it. In this case the skew between the outputs of the two devices is guaranteed to be less than 700 pS.

ASM5P2308A is available in five different configurations. Refer to *ASM5P2308A Configurations Table*. The ASM5P2308A-1 is the base part, where the output frequencies equal the reference clock input. The ASM5P2308A-1H is the high-drive version of the -1 and the rise and fall times on this device are faster.

ASM5P2308A-2 allows the user to obtain 2x and 1x frequencies on each output bank. The exact configuration and output frequencies depends on which output drives the feedback pin. ASM5P2308A-3 allows the user to obtain 4x and 2x frequencies on the outputs.

ASM5P2308A-4 enables the user to obtain 2x clocks on all outputs.

The ASM5P2308A-5H is a high-drive version with REF/2 output on both banks.

ASM5P2308A is an extremely versatile part, and can be used in a variety of applications.

### Features

- Zero Input-output Propagation Delay, Adjustable by Capacitive Load on FBK Input
- Multiple Configurations –  
Refer to *ASM5P2308A Configurations Table*
- Input Frequency Range: 10 MHz to 133 MHz
- Multiple Low-skew Outputs
  - ◆ Output-output Skew less than 200 pS
  - ◆ Device-device Skew less than 700 pS
  - ◆ Two Banks of Four Outputs Each, Three-state by Two Select Inputs
- Less than 200 pS Cycle-to-Cycle Jitter (-1, -1H, -2, -3, -4, -5H)
- 16-pin SOIC and TSSOP Packages
- 3.3 V Operation
- Commercial and Industrial Temperature Range
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

## Zero Delay and Skew Control

All outputs should be uniformly loaded to achieve Zero Delay between input and output.

Figure 2. Output Load Difference: FBK Load – CLKA/CLKB Load (pF)

To close the feedback loop of the ASM5P2308A, the FBK can be driven from any of the eight available clock outputs. The output driving the FBK pin will be driving a total load of 7 pF plus any additional load that it drives. The relative loading of this output (with respect to the remaining outputs) can adjust the input–output delay. This is shown in the above graph.

For applications requiring zero input–output delay, all outputs including the one providing feedback should be equally loaded. If input–output delay adjustments are required, use the above graph to calculate loading differences between the feedback output and remaining outputs. For zero output–output skew, be sure to load outputs equally.
