

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

OVERVIEW

The **P95020** is designed to provide maximum flexibility to system designers by providing full customization and programmability. It is the first of a new generation of standardized application-specific controllers that incorporates a general purpose microcontroller, a high fidelity audio CODEC including headphone outputs and a 2.5W Class D audio amplifier, full power management functionality, a touch screen controller and a real time clock all of which are required by portable consumer devices such as cellular phone handsets, portable gaming devices, digital media players, portable navigational devices, etc.

The general purpose microcontroller controls the device power-on/power-off sequencing and can also be used for general system housekeeping.

The P95020 includes two I²C Interfaces, a master for communicating with an external EEPROM and a slave for communicating with the host.

The high fidelity audio CODEC along with headphone outputs and the 2.5 watt Class D audio speaker amplifier comprise a total audio solution for portable applications.

The switch-mode EnergyPath™ Battery Charger operates with its own high efficiency buck regulator to transmit the 2.5 watts available from a USB port to the system with minimal wasted power. It can also handle up to 2A from a wall charger.

Its power management features along with switch-mode converters and LDOs should be sufficient to provide power for even the most complex hand-held devices.

The integrated touch screen controller allows adding touch screen capability to devices at significantly reduced cost.

It also includes IDT's high quality, low power real time clock.

APPLICATIONS

Smart Phones
Portable Gaming Device
Digital Media Players
Portable Navigational Devices

KEY FEATURES

Quick Turn Customization

Embedded Microcontroller

- ◆ Master Controller during Power Up & Power-Down
 - Initialization and power sequencing
 - Dynamic Power Management via I²C bus interface
 - Up to 10 General Purpose I/Os available
 - General house keeping for P95020 and other devices

Audio Features

- ◆ 4 Channel CODEC with 24-bit resolution and internal registers for status and control
- ◆ Integrated 2.5 Watt Mono Class D Amplifier with Filterless Operation.
- ◆ Stereo cap-less headphone driver
- ◆ Differential Analog Audio Line Inputs
- ◆ Dual Mode Microphone Inputs (Analog or DMIC)

Battery Charging Circuit

- ◆ Autonomous Li-Ion/Li-Poly charger up to 1.5A
 - Automatic Load Prioritization
 - Advanced Battery Safety features
- ◆ High efficiency switch-mode *EnergyPath™ controller
- ◆ USB or Wall-mounted Charging
 - Programmable Current Limit
 - Automatic end-of-charge control
- ◆ Internal 180 mΩ ideal diode with external ideal diode controller

Power Management Features

- ◆ All Converters:
 - Power up/down sequence field reprogrammable with external EEPROM
 - Dynamic voltage scaling
 - Host or I²C output enable / disable
- ◆ Buck DC-DC PWM converters with PFM mode
 - Two at 500mA, 0.75V to 3.7V
 - One at 1000mA, 0.75V to 3.7V
- ◆ Boost DC-DC converters
 - One at 1.5 A peak on inductor, 4.05V to 5.0V
 - One LED supply with 2 W total output power
 - Two programmable current sinks, @ 25mA each
 - Voltage limited to rating of external FET & diode
- ◆ Linear Regulators
 - Three LDOs at 150mA, 0.75V to 3.7V
 - Four LDOs at 50mA, 0.7V to 3.7V
 - One always-on LDO at 10mA, 3.3 or 3.0V

ADC and Touch Screen Controller

- ◆ 4-wire touch screen interface
- ◆ One direct battery measurement channel
- ◆ One direct VSYS measurement channel
- ◆ One direct charge current measurement channel
- ◆ On-Chip temperature measurement
- ◆ Four auxiliary analog input channels (shared with GPIO pins)
- ◆ Touch pressure measurement
- ◆ Sample rate: 62.5k SPS
- ◆ 12 bit resolution, DNL: -1~+2 LSB, INL: +-2
- ◆ On-chip 2.5V reference

I/O LEVELS BY TYPE

I/O TYPE	DESCRIPTION
A-I, A-O & A-IO	Analog Levels: Input, Output & Input/Output
AP-I, AP-O & AP-I/O	Power Supply: Input, Output & Input/Output
D-I, D-O	Digital Levels: Input, Output Voltage levels are all digital levels (nominally 3.3V)
GND	Ground: Any connection to Ground
GPIO-IN, GPIO-OUT, GPIO	General Purpose: Input, Output, Input/Output. Inputs are 3.3V Outputs are V_{SYS} with open-drain capable
I2C-I, I2C-O & I2CIO	I²C: Input, Output & Input/Output Inputs are CMOS Outputs are open-drain.
TCXO-D-I, TCXO-D-O, TCXO-IO	Clock: Input, Output, Input/Output Inputs are 1.8V, Outputs are 1.1V to 1.9V

ABSOLUTE MAXIMUM RATINGS

Stresses above the ratings listed below can cause permanent damage to the P95020. These ratings are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

ESD: The P95020 is an ESD (electrostatic discharge) sensitive device. The human body and test equipment can accumulate and discharge electrostatic charges up to 4000 Volts without detection. Even though the P95020 implements internal ESD protection circuitry, proper ESD precautions should be followed to avoid damaging the functionality or performance.

1.0 OVERVIEW

The P95020 is an integrated device that combines a microcontroller, power management, battery charging, touch screen controller, system monitoring, clock synthesis, real time clock and audio functionality. All of these subsystems are configured, monitored and controlled by either the on-chip Microcontroller or by an external controller (Application Processor) over an I²C interface. The external Application Processor can monitor and control functions within P95020 even when the internal Microcontroller is enabled. The registers for the various sub functions allow access from more than one controller through an arbitration mechanism implemented in hardware.

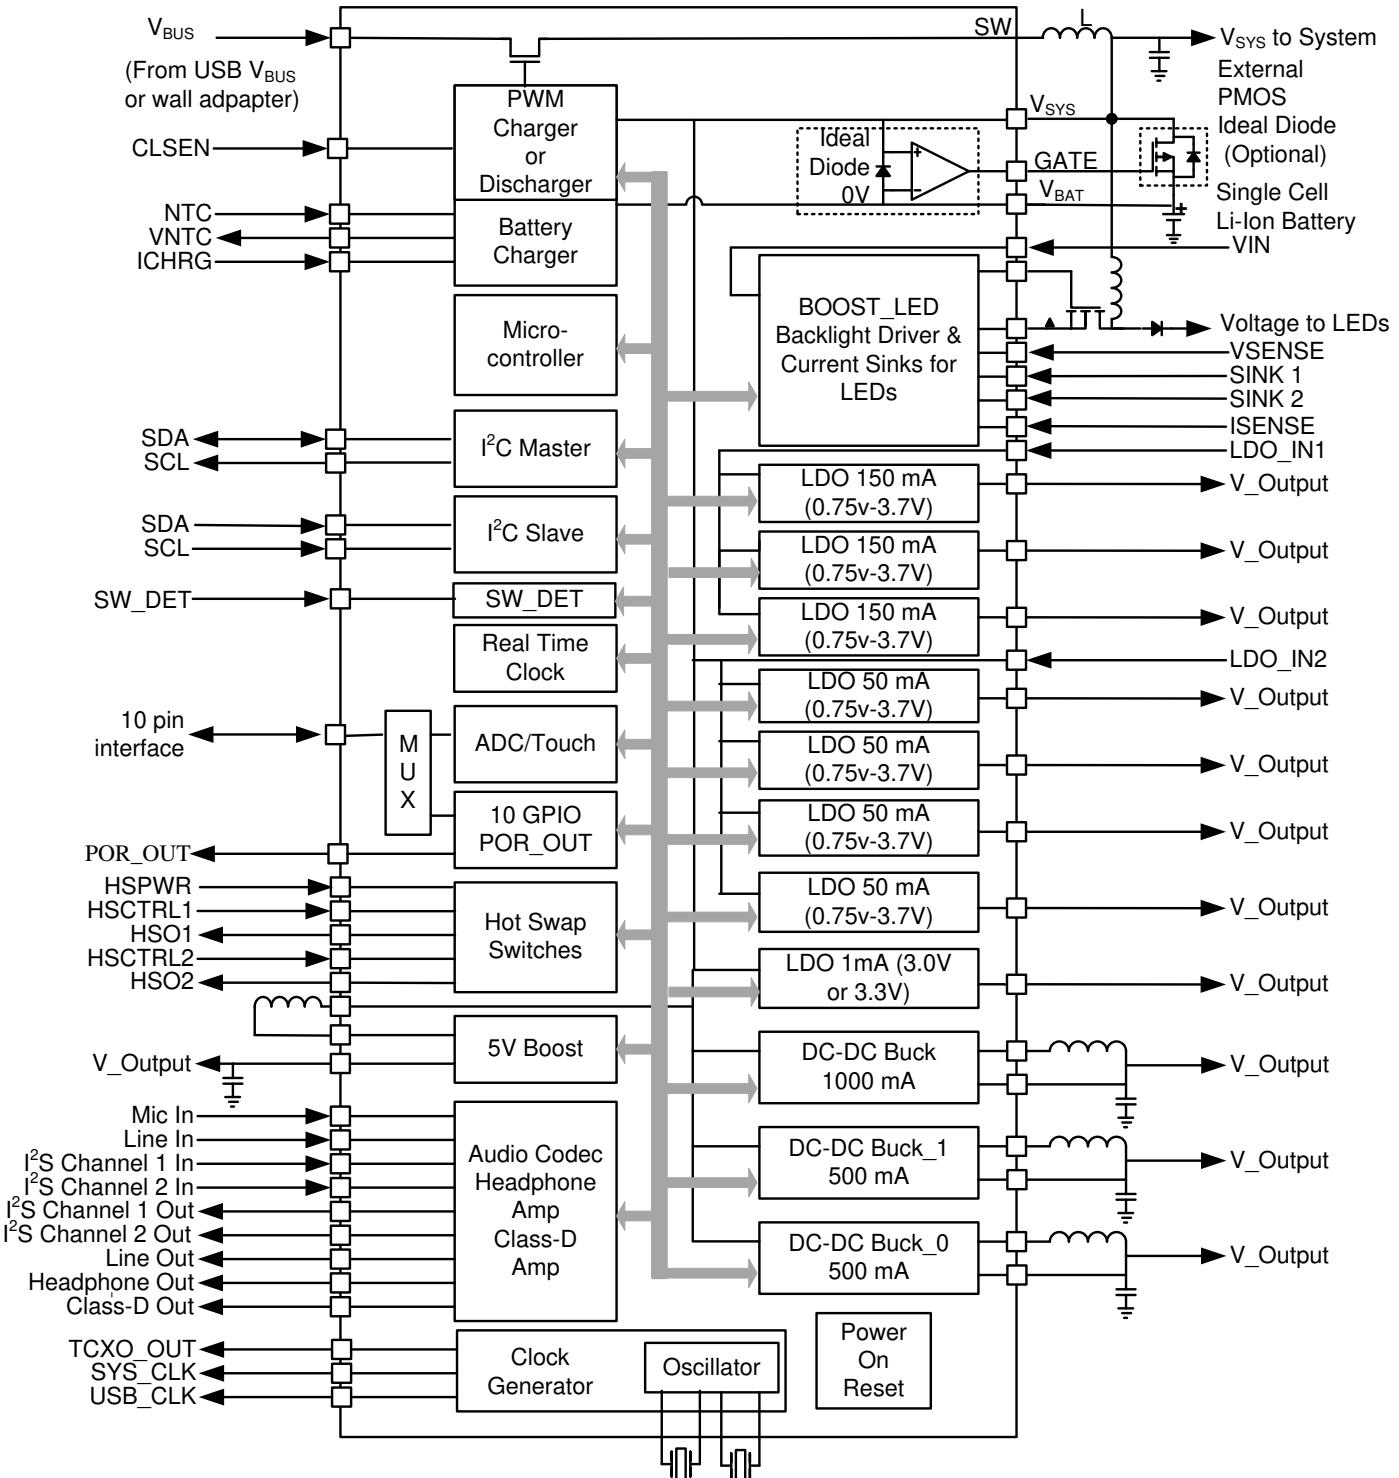

Figure 4 – Overall System Functional Diagram.

1.1 FUNCTIONAL MODES

There are two primary functional modes for operation: external processor only or simultaneous internal and external processor operation.

External Processor Control

In this mode of operation the external processor can access all internal registers via the I²C interface and receive interrupts via an interrupt pin, and the internal Microcontroller can be powered down or clock gated off.

Combined Internal and External Processor Operation

In this mode of operation the Microcontroller in the P95020 will function autonomously or semi-autonomously based on the content of the on-board or external ROM. The external Application Processor may or may not perform additional control functions through the I²C bus interface. Individual time-based or event-based interrupts generated inside the P95020 device may be routed internally or externally to be handled separately. All I²C registers can be simultaneously accessed by either the external Application Processor or the internal Microcontroller. Access to the I²C registers is arbitrated via on-chip hardware arbitration.

1.2 REGISTER MAP

All the P95020 control and status registers accessible to the Microprocessor are mapped to a 1024 location address space. This address space maps to:

4 x 256 Bytes of I²C pages for the I²C slave interface

1024 consecutive addresses in the embedded Microprocessor address space

For easy access from the I²C slave interface (by default 256 Bytes oriented) the first 16 registers of each page are global for all the pages.

Each Module is allocated a consecutive address space.

Register address computation: Address = Base Address + Offset Address

The Base addresses (for both I²C and embedded uP) are listed in the following table. The Offset addresses are defined in different functional Modules. The offset address is labeled as "Offset Address" in the Module Register definition sections.

Table 3 – Register Address Global Mapping

1.3 BYTE ORDERING AND OFFSET

Most registers are defined within one byte width and occupy one byte in the address space. Some registers occupy more than one byte. Please refer to the individual register descriptions for information on how that register is stored in address space.

1.4 REGISTER ACCESS TYPES

TYPE	MEANING
RW	Readable and Writeable
R	Read only
RW1C	Readable and Write 1 to this bit to clear it (for interrupt status)
RW1A	Readable and Write 1 to this bit to take actions

1.5 RESERVED BIT FIELDS

Bit fields and Bytes labeled *RESERVED* are reserved for future use. When writing to a register containing some *RESERVED* bits, the user should do a “read-modify-write” such that only the bits which are intended to be written are modified.

DO NOT WRITE to registers containing all *RESERVED* bits.

2.0 AUDIO MODULE

FEATURES

- 4 Channels (2 stereo DACs and 2 stereo ADCs) with 24-bit resolution
 - ◆ Supports full-duplex stereo audio
 - ◆ Provides a mono output
- 2.5W mono speaker amplifier @ 4 ohms and 5V
- Stereo cap-less headphone amplifier
- Two digital microphone inputs
 - ◆ Mono or stereo operation
 - ◆ Up to 4 microphones in a system
- High performance analog mixer
- 2 adjustable analog microphone bias outputs

DESCRIPTION

The audio system is a low power optimized, high fidelity, 4-channel audio codec with integrated Class D speaker amplifier, cap-less headphone amplifier. It provides high quality HD Audio capability for handheld applications.

026	HP_L	Cap-less headphone output (left channel)
027	AGND	Analog (audio) return
028	VIRT_GND	Cap-less headphone signal return (virtual ground)

2.2 AUDIO - SECTION OVERVIEW

The Audio section can be divided into seven subsections.

Analog Input Buffer & Converter Block

DAC, ADC

Audio Mixer Block

Analog and Class D Output Blocks

Sub System Control and Interface Blocks

Note: All register settings are lost when power is removed.

2.4 AUDIO - MICROPHONE INPUT PORT

The microphone input port supports either analog or digital microphones. The analog and digital modes share pins so only one mode is supported in a typical application.

2.4.1 AUDIO - Analog Microphone Input mode

The Analog Microphone input path consists of:

Stereo Differential Input Analog Microphone Buffer

- ◆ L/R swap
- ◆ Mono or stereo
- ◆ Microphone Bias Generator with 2 independent bias outputs.
- ◆ Microphone Boost Amplifier with selectable gain of 10, 20, or 30dB

The analog microphone interface provides a stereo differential input for supporting common electret cartridge microphones in a balanced configuration (a single-ended configuration is also supported). A boost amplifier provides up to 30dB of gain to align typical microphone full scale outputs to the ADC input range. The microphone input is then routed

to both ADC1 and the analog mixer for further processing. By using the analog mixer the analog microphone input may be routed to ADC0, the line output port or the headphone output port.

2.4.2 AUDIO - Digital Microphone Input mode

The Digital Microphone Input path consists of:

Digital Microphone input buffer and MUX with the following features:

- One or two microphones per DMICDATx input.
- Mono data sampled during high or low clock level.
- L/R swap
- Versatile DMICSEL output pin for control of digital microphone modules or other external circuitry. (Used primarily to enable/disable microphones that do not support power management using the clock pin.)

The digital microphone interface permits connection of a digital microphone(s) via the DMICDAT1, DMICDAT2, and DMICCLK 3-pin interface. The DMICDAT1 and DMICDAT2 signals are inputs that carry individual channels of digital microphone data to the ADC. In the event that a single microphone is used, the data is ported to both ADC channels. This mode is selected using a register setting and the left time slot is copied to the ADC left and right inputs. The digital microphone input is only available at ADC1.

The DMICCLK output is controllable from 4.704 MHz, 3.528 MHz, 2.352 MHz, 1.176 MHz and is synchronous to the internal master clock (MCLK). The default frequency is 2.352 MHz.

To conserve power, the analog portion of the ADC and the analog boost amplifier will be turned off if the D-mic input is selected. When switching from the digital microphone to an analog input to the ADC, the analog portion of the ADC will be brought back to a full power state and allowed to stabilize before switching from the digital microphone to the analog input. This should take less than 10mS.

The P95020 codec supports the following digital microphone configurations:

Table 4 - Valid Digital Mic Configurations

MODE	DIGITAL MICS	DATA SAMPLE	INPUT	NOTES
0	0	N/A	N/A	No Digital Microphones (1010 bit pattern sent to ADC to avoid pops)
1	2	Double Edge	DMICDAT1	Two microphones connected to DMICDAT1. PhAdj settings apply to Left microphone. Right Microphone sampled on opposite phase. DMICDAT2 ignored.
2	2	Double Edge	DMICDAT2	Two microphones connected to DMICDAT2. PhAdj settings apply to Left microphone. Right Microphone sampled on opposite phase. DMICDAT1 ignored.
3	2	Single Edge	DMICDAT1 and DMICDAT2	DMICDAT1 used for left data and DMICDAT2 used for right data.
3	2	Double Edge	DMICDAT1 and DMICDAT2	Two microphones, one on each data input. "Left" microphone used for each channel. Two "Right" microphones may be used by inverting the microphone clock or adjusting the sample phase.
