

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

PACVGA200

VGA Port Companion Circuit

Product Description

The PACVGA200 incorporates seven channels of ESD protection for all signal lines commonly found in a VGA port. ESD protection is implemented with current steering diodes designed to safely handle the high surge currents encountered with IEC-61000-4-2 Level-4 ESD Protection (± 8 kV contact discharge). When a channel is subjected to an electrostatic discharge, the ESD current pulse is diverted via the protection diodes into either the positive supply rail or ground where it may be safely dissipated. Separate positive supply rails are provided for the VIDEO, DDC and SYNC channels to facilitate interfacing with low voltage Video Controller ICs and provide design flexibility in multi-supply-voltage environments.

Two non-inverting drivers provide buffering for the HSYNC and VSYNC signals from the Video Controller IC (SYNC_IN1, SYNC_IN2). These buffers accept TTL input levels and convert them to CMOS output levels that swing between Ground and V_{CC4} .

These drivers have nominal 60Ω output impedance (R_S) to match the characteristic impedance of the HSYNC & VSYNC lines of the video cables typically used in PC applications. Two N-channel FETs provide the level shifting function required when the DDC controller is operated at a lower supply voltage than the monitor. Three 75Ω termination resistors suitable for terminating the video signals from the video DAC are also provided. These resistors have separate input pins to allow insertion of additional EMI filtering, if required, between the termination point and the ESD protection diodes. These resistors are matched to better than 2% for excellent signal level matching for the R/G/B signals.

When the PWR_UP input is driven LOW, the SYNC inputs can be floated without causing the SYNC buffers to draw any current from the V_{CC4} supply. When the PWR_UP input is LOW, the SYNC outputs are driven LOW.

An internal diode (D1 in schematic on previous page) is also provided so that V_{CC3} can be derived from V_{CC4} , if desired, by connecting V_{CC3} to V_{BIAS} . In applications where V_{CC4} may be powered down, diode D1 blocks any DC current paths from the DDC_OUT pins back to the powered down V_{CC4} rail via the top ESD protection diodes.

Features

- Single Chip Solution for the VGA Port Interface
- Includes ESD Protection, Level Shifting, and RGB Termination
- Seven Channels of ESD Protection for All VGA Port Connector Pins Meeting IEC-61000-4-2 Level-4 ESD Requirements (± 8 kV Contact Discharge)
- Very Low Loading Capacitance from ESD Protection Diodes on VIDEO Lines, 4 pF Typical

Applications

- Notebook Computers with VGA Port

PACVGA200

Table 1. PIN DESCRIPTIONS

Lead(s)	Name	Description
1	V _{CC4}	Positive voltage supply pin. This is an isolated V _{CC} pin for the SYNC_1, SYNC_2, SD1 and SD2 circuits.
2	V _{CC1}	Positive voltage supply pin. This is an isolated V _{CC} pin for the VIDEO_1, VIDEO_2 and VIDEO_3 ESD circuits.
3-5	VIDEO_1, VIDEO_2, VIDEO_3	RGB Video Protection Channels. These pins tie to the RGB video lines (for example, the Blue signal) between the VGA controller device and the video connector.
6	GNDD	Digital Ground reference supply pin.
7	GNDA	Ground reference supply pin for TERM_1, TERM_2 and TERM_3 pins.
8-10	TERM_1, TERM_2, TERM_3	RGB Video Termination Channels. These pins tie to the RGB video lines (for example, the Blue signal) providing a 75 Ω termination to GNDA for the given video channel.
11	PWR_UP	Sync Signal Output 1. Ties to the video connector side of one of the sync lines (for example the Horizontal Sync signal).
12	V _{CC2}	Positive voltage supply pin. This is an isolated V _{CC} pin for the DDC_IN1 and DDC_IN2 input circuits. Defines the logic one level for the DDC_OUTn outputs.
13	V_BIAS	Used to derive V _{CC3} from V _{CC4} input.
14	V _{CC3}	Positive voltage supply pin. This is an isolated V _{CC} pin for the DDC_OUT1 and DDC_OUT2 ESD protection circuits.
15	DDC_OUT1	DDC Signal Output 1. Connects to the connector side of one of the DDC signals (for example, the bidirectional DDC_Data serial line).
16	DDC_IN1	DDC Signal Input 1. Connects to the VGA Controller side of one of the DDC signals (for example, the bidirectional DDC_Data serial line).
17	DDC_IN2	DDC Signal Input 2. Connects to the VGA Controller side of one of the DDC signals (for example, the bidirectional DDC_Clk).
18	DDC_OUT2	DDC Signal Output 2. Connects to the connector side of one of the DDC signals (for example, the bidirectional DDC_Clk).
19	SYNC_IN1	Sync Signal Buffer Input 1. Connects to the VGA Controller side of one of the sync lines (for example, the Horizontal Sync signal).
20	SYNC_OUT1	Sync Signal Buffer Output 1. Connects to the video connector side of one of the sync lines (for example the Horizontal Sync signal).
21	SYNC_IN2	Sync Signal Buffer Input 2. Connects to the VGA Controller side of one of the sync lines (for example, the Vertical Sync signal).
22	SYNC_OUT2	Sync Signal Buffer Output 2. Connects to the video connector side of one of the sync lines (for example the Vertical Sync signal).
23	SD1	Sync Signal Filter 1. Connects to the video connector side of one of the sync lines (for example the Vertical Sync signal).
24	SD2	Sync Signal Filter 2. Connects to the video connector side of one of the sync lines (for example the Horizontal Sync signal).

Table 4. ELECTRICAL OPERATING CHARACTERISTICS (Note 1)

Symbol	Parameter	Conditions	Min	Typ	Max	Units
I_{OFF}	Off-State Leakage Current, Level-Shifting NFET	$(V_{CC2} - V_{DDC_IN}) \leq 0.4 V$, $V_{DDC_OUT} = V_{CC2}$ $(V_{CC2} - V_{DDC_OUT}) \leq 0.4 V$, $V_{DDC_IN} = V_{CC2}$			10 10	μA
V_{ON}	Voltage Drop Across Level Shifting NFET when Turned ON	$V_{CC2} = 2.5 V$, $V_S = GND$, $I_{DS} = 3 mA$			0.15	V
C_{IN}	Input Capacitance VIDEO_1, VIDEO_2 & VIDEO_3 Inputs	$V_{CC1} = 5.0 V$, $V_{IN} = 2.5 V$, Measured at 1 MHz $V_{CC1} = 2.5 V$, $V_{IN} = 1.25 V$, Measured at 1 MHz	3.0 3.0	4.0 4.5	5.0 5.6	pF
t_{PLH}	SYNC Drivers L \geq H Propagation Delay	$C_L = 50 pF$, $V_{CC} = 5.0 V$, Input t_R and $t_F \leq 5 ns$		8.0	12.0	ns
t_{PHL}	SYNC Drivers H \geq L Propagation Delay	$C_L = 50 pF$, $V_{CC} = 5.0 V$, Input t_R and $t_F \leq 5 ns$		8.0	12.0	ns
t_R, t_F	SYNC Drivers Output Rise & Fall Times	$C_L = 50 pF$, $V_{CC} = 5.0 V$, Input t_R and $t_F \leq 5 ns$ (Measured 10% - 90%)	5.0	7.0	10.0	ns
V_{ESD}	ESD Withstand Voltage	$V_{CC1} = V_{CC3} = V_{CC4} = 5 V$ (Note 3)	± 8			kV

1. All parameters specified over standard operating conditions unless otherwise noted.
2. This parameter applies only to the HSYNC and VSYNC channels. HSYNC and VSYNC have 8 mA drivers with R_S added in series to terminate transmission line.
3. Per the IEC-61000-4-2 International ESD Standard, Level 4 contact discharge method. V_{CC1} , V_{CC3} and V_{CC4} must be bypassed to GND via a low impedance ground plane with a 0.2 μF , low inductance, chip ceramic capacitor at each supply pin. ESD pulse is applied between the applicable pins and GND. ESD pulse can be positive or negative with respect to GND. Applicable pins are: VIDEO_1, VIDEO_2, VIDEO_3, SYNC_OUT1, SD1, SYNC_OUT2, SD2, DDC_OUT1 and DDC_OUT2. All other pins are ESD protected to the industry standard 2 kV per the Human Body Model (MIL-STD-883, Method 3015).

PACVGA200

TEST CIRCUIT INFORMATION

Average Current through V_{CC4} (I_{CC4})

The circuit in Figure 1 was used to characterize I_{CC4} current as SYNC_IN signal frequency varies. A square wave signal was connected to the input of one of the SYNC buffers (i.e. pin 19 or pin 21). The frequency of this signal was varied between 0 and 100 kHz. The risetime and falltime was kept constant at 10 ns. Three different values of C1 were used: 0 pF, 50 pF and 100 pF. The results are plotted in Figure 2.

Figure 1. Sync Buffer I_{CC4} Test Circuit

Figure 2. I_{CC4} vs. SYNC_IN Frequency Performance Data

PACVGA200

APPLICATION INFORMATION

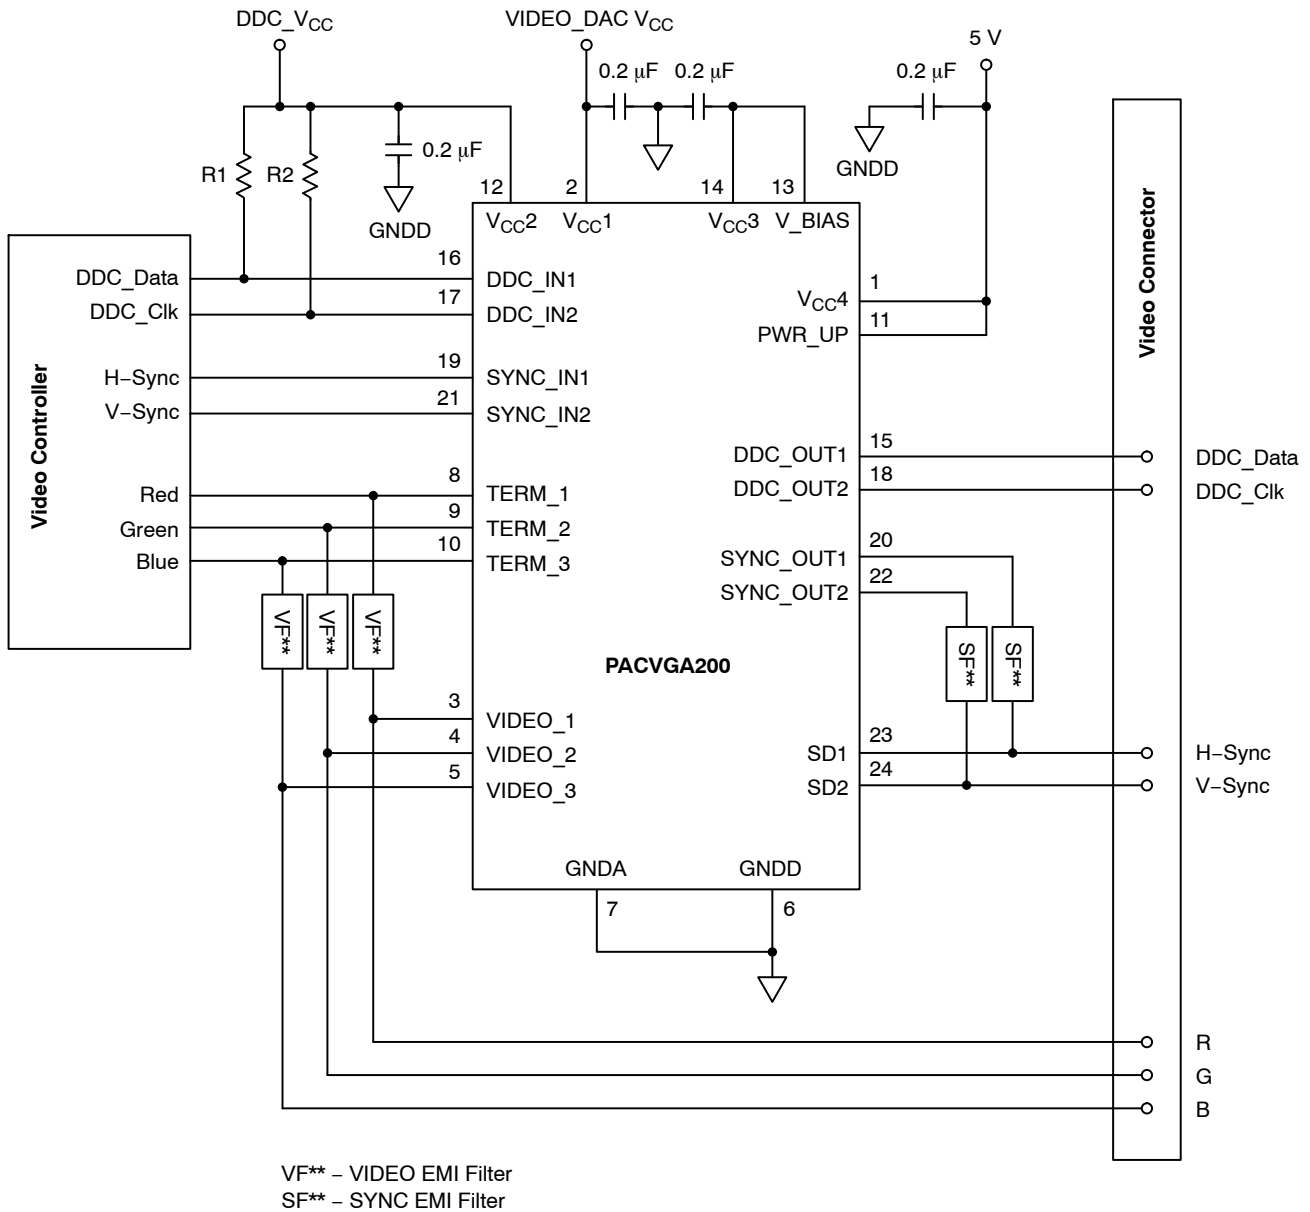

Figure 3. Typical Connection Diagram

A resistor may be necessary between the V_{CC3} pin and ground if protection against a stream of ESD pulses is required while the PACVGA200 is in the power-down state. The value of this resistor should be chosen such that the extra charge deposited into the V_{CC3} bypass capacitor by each ESD pulse will be discharged before the next ESD pulse occurs. The maximum ESD repetition rate specified by the IEC-61000-4-2 standard is one pulse per second. When the PACVGA200 is in the power-up state, an internal discharge resistor is connected to ground via an FET switch for this purpose.

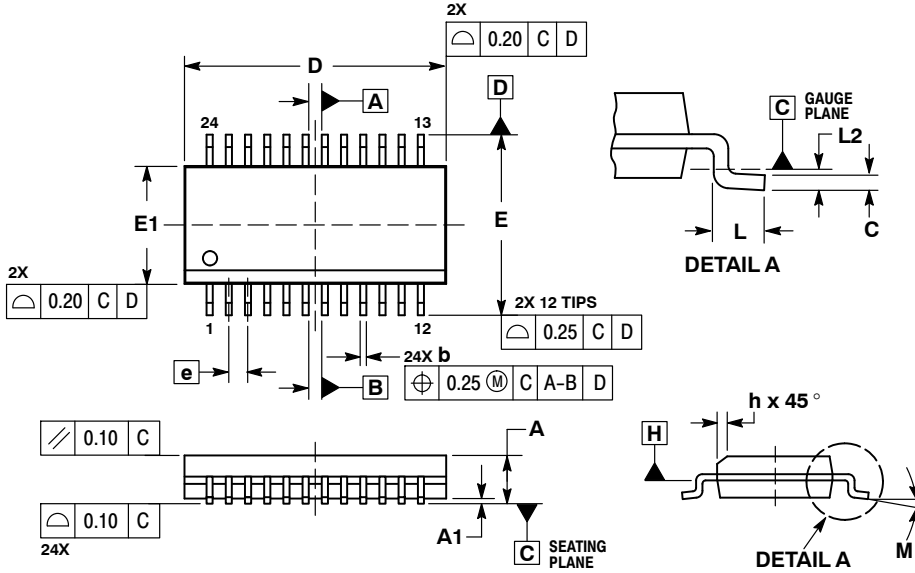

For the same reason, V_{CC1} and V_{CC4} may also require bypass capacitor discharging resistors to ground if there are no other components in the system to provide a discharge path to ground.

GNDA, the reference voltage for the 75 Ω resistors is not connected internally to GNDD and should ideally be connected to the ground of the video DAC IC.
