

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

PACVGA201

VGA Port Companion Circuit

Product Description

The PACVGA201 provides seven channels of ESD protection for all signal lines commonly found in a VGA port. ESD protection is implemented with current-steering diodes designed to safely handle the high surge currents encountered with IEC-61000-4-2 Level-4 ESD Protection (± 8 kV contact discharge). When a channel is subjected to an electrostatic discharge, the ESD current pulse is diverted via the protection diodes into the positive supply rail or ground where it may be safely dissipated.

Separate positive supply rails are provided for the VIDEO, DDC_OUT and SYNC channels to facilitate interfacing with low-voltage video controller ICs and to provide design flexibility in multiple-supply-voltage environments.

An internal diode (D_1 , in schematic below) is provided such that V_{CC2} is derived from V_{CC3} (V_{CC2} does not require an external power supply input). In applications where V_{CC3} may be powered down, diode D_1 blocks any DC current path from the DDC_OUT pins back to the powered down V_{CC3} rail via the upper ESD protection diodes.

Two non-inverting drivers provide buffering for the HSYNC and VSYNC signals from the Video Controller IC (SYNC_IN1, SYNC_IN2). These buffers accept TTL input levels and convert them to CMOS output levels that swing between Ground and V_{CC3} .

When the PWR_UP input is driven LOW, the SYNC outputs are driven LOW and the SYNC inputs can float: no current will be drawn from the V_{CC3} supply.

The PACVGA201 is housed in a 16-pin QSOP package with RoHS compliant lead-free finishing.

Features

- Seven Channels of ESD Protection for All VGA Port Connector Pins
- Meets IEC-61000-4-2 Level-4 ESD Requirements (± 8 kV Contact Discharge)
- Very Low Loading Capacitance from ESD Protection Diodes on VIDEO Lines, 4pF Typical
- TTL to CMOS Level-Translating Buffers with Power Down Mode for HSYNC and VSYNC Lines
- Three Power Supplies for Design Flexibility
- Compact 16-Pin QSOP Package
- These Devices are Pb-Free and are RoHS Compliant

Applications

- ESD Protection and Termination Resistors for VGA (Video) Port Interfaces
- Desktop PCs
- Notebook Computers
- LCD Monitors

Table 1. PIN DESCRIPTIONS

Pin(s)	Name	Description
1	V _{CC3}	V _{CC3} supply pin. This is an isolated supply input for the two sync buffers and SD1 and SD2 ESD protection circuits.
2	V _{CC1}	V _{CC1} supply pin. This is an isolated supply pin for the VIDEO_1, VIDEO_2 and VIDEO_3 ESD protection circuits.
3	VIDEO_1	Video signal ESD protection channel. This pin is typically tied one of the video lines between the VGA controller device and the video connector.
4	VIDEO_2	Video signal ESD protection channel. This pin is typically tied one of the video lines between the VGA controller device and the video connector.
5	VIDEO_3	Video signal ESD protection channel. This pin is typically tied one of the video lines between the VGA controller device and the video connector.
6	GND	Ground reference supply pin.
7	PWR_UP	Enables the sync buffers when high. When PWR_UP is low the sync outputs are forced low and the inputs can be floated.
8	V _{CC2}	V _{CC2} supply pin. This is an isolated supply pin for the DDC_OUT1 and DDC_OUT2 ESD protection circuits. Internally, V _{CC2} is derived from the V _{CC3} input if the V _{CC2} input is not connected to a supply voltage.
9	DDC_OUT1	DDC_OUT1 ESD protection channel.
10	DDC_OUT2	DDC_OUT2 ESD protection channel.
11	SYNC_IN1	Sync signal buffer input. Connects to the VGA Controller side of one of the sync lines.
12	SYNC_OUT1	Sync signal buffer output. Connects to the video connector side of one of the sync lines.
13	SYNC_IN2	Sync signal buffer input. Connects to the VGA Controller side of one of the sync lines.
14	SYNC_OUT2	Sync signal buffer output. Connects to the video connector side of one of the sync lines.
15	SD1	ESD protection channel input.
16	SD2	ESD protection channel input.

1. All parameters specified over standard operating conditions unless otherwise noted.
2. These parameters apply only to SYNC_IN1, SYNC_IN2 and PWR_UP.
3. These parameters apply only to SYNC_OUT1 and SYNC_OUT2.
4. Per the IEC-61000-4-2 International ESD Standard, Level 4 contact discharge method. V_{CC1}, V_{CC2} and V_{CC3} must be bypassed to GND via a low impedance ground plane with a 0.2 μF or greater, low inductance, chip ceramic capacitor at each supply pin. ESD pulse is applied between the applicable pins and GND. ESD pulse can be positive or negative with respect to GND. Applicable pins are: VIDEO_1, VIDEO_2, VIDEO_3, SYNC_OUT1, SD1, SYNC_OUT2, SD2, DDC_OUT1 and DDC_OUT2. All other pins are ESD protected to the industry standard 2 kV per the Human Body model (MIL-STD-883, Method 3015).

APPLICATION INFORMATION

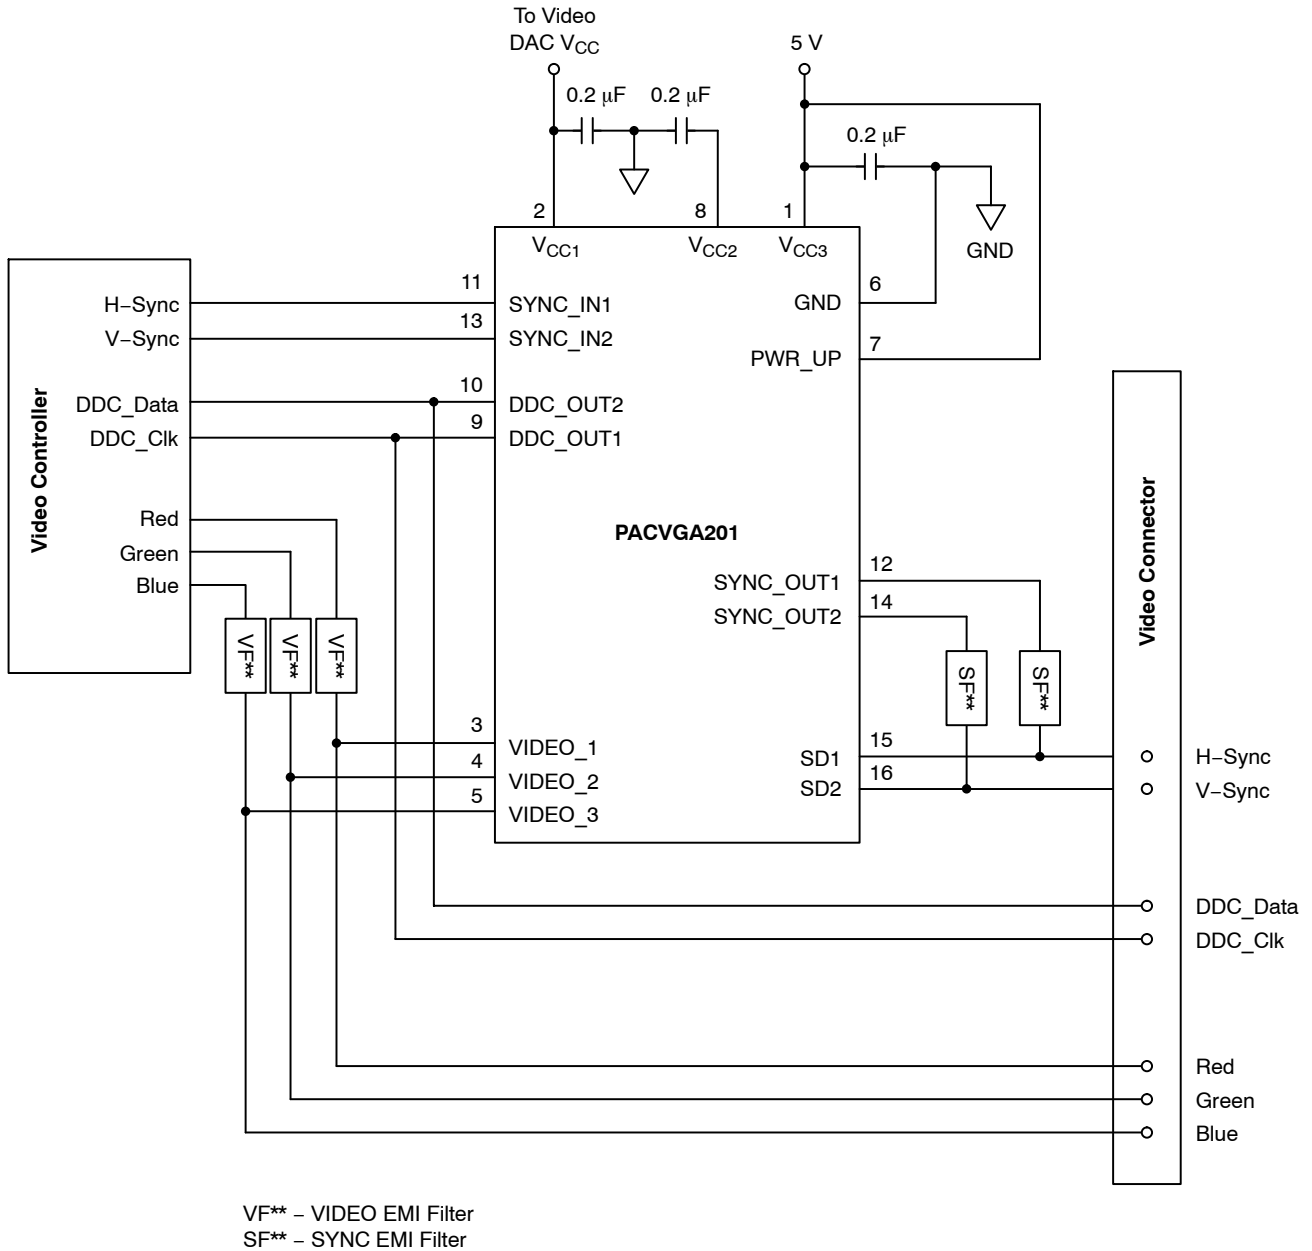

Figure 1. Typical Connection Diagram

A resistor may be necessary between the V_{CC2} pin and ground if protection against a stream of ESD pulses is required while the PACVGA201 is in the power-down state. The value of this resistor should be chosen such that the extra charge deposited into the V_{CC2} bypass capacitor by each ESD pulse will be discharged before the next ESD pulse occurs. The maximum ESD repetition rate specified by the IEC-61000-4-2 standard is one pulse per second. When the PACVGA201 is in the power-up state, an internal discharge resistor is connected to ground via a FET switch for this purpose.

For the same reason, V_{CC1} and V_{CC3} may also require bypass capacitor discharging resistors to ground if there are no other components in the system to provide a discharge path to ground.
