

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# PC928 Series

**Built-in Short Protection Circuit,  
Gate Drive SMD 14 pin \*OPIC  
Photocoupler**

## ■ Description

**PC928 Series** contains an IRED optically coupled to an OPIC chip.

It is packaged in a Mini-flat, Half pitch type (14 pin).  
Input-output isolation voltage(rms) is 4.0kV.

## ■ Features

1. 14 pin Half lead pin pitch (Lead pitch=1.27 mm) package type
2. Double transfer mold package  
(Ideal for Flow Soldering)
3. Built-in IGBT shortcircuit protector circuit
4. Built-in direct drive circuit for IGBT drive  
(Peak output current :  $I_{O1P}$ ,  $I_{O2P}$  : MAX. 0.4 A)
5. High isolation voltage ( $V_{iso(rms)}$  : 4.0 kV)

## ■ Agency approvals/Compliance

1. Recognized by UL1577, file No. E64380 (as model No. **PC928**)
2. Approved by VDE (VDE0884) (as an option) file No. 94626 (as model No. **PC928**)
3. Package resin : UL flammability grade (94V-0)

## ■ Applications

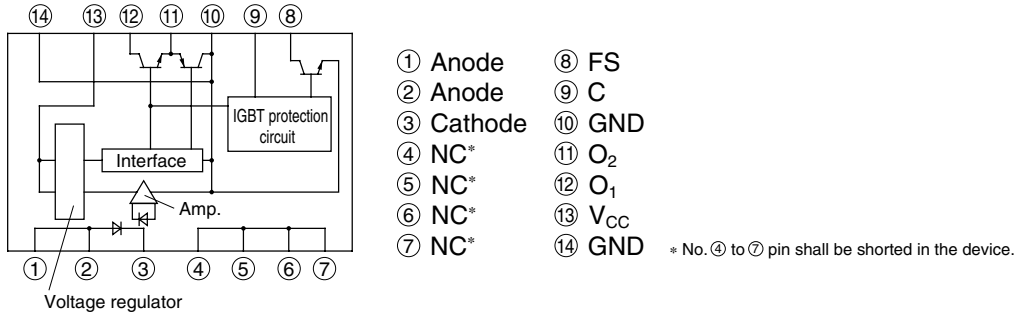

1. Inverter

\* "OPIC"(Optical IC) is a trademark of the SHARP Corporation. An OPIC consists of a light-detecting element and a signal-processing circuit integrated onto a single chip.

Notice The content of data sheet is subject to change without prior notice.

In the absence of confirmation by device specification sheets, SHARP takes no responsibility for any defects that may occur in equipment using any SHARP devices shown in catalogs, data books, etc. Contact SHARP in order to obtain the latest device specification sheets before using any SHARP device.

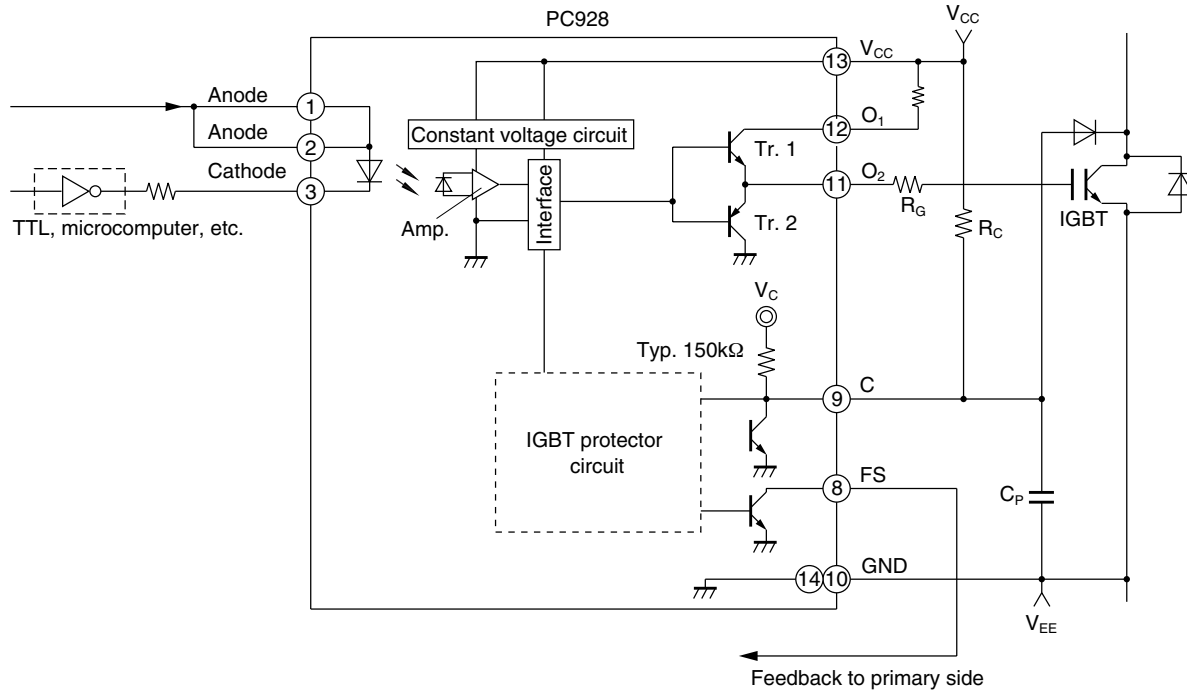

**Fig.40 Example of The Application Circuit (IGBT Drive for Inverter)**

- In order to stabilize the power supply line, we recommend to locate a bypass capacitor  $C_B$  (0.01 $\mu$ F or more) between  $V_{CC}$  and GND near photocoupler.
- In order to stabilize the detecting voltage of pin-C, we recommend to locate a capacitor  $C_P$  (approximately 1 000pF) between pin-C and GND, and a resistor  $R_C$  (approximately 1.0k $\Omega$ ) between  $V_{CC}$  and pin-C. However, the rise time of the detection voltage at Pin-C varies along with the time constants of  $C_P$  and  $R_C$ . So, please make sure the device works properly in actual conditions.
- For the diode D, which is located between pin-C and collector of IGBT, we recommend to use a diode that has the withstand voltage characteristic equivalent to IGBT and also has little leak current.
- In order to prevent the failure mode or breakdown of pin-C from  $V_{CE}$  variation of IGBT, we recommend to locate a resistor  $R_2$  (approximately 10k $\Omega$ ) and a diode D1 at near pin-C, and a resistor  $R_3$  (approximately 50k $\Omega$ ) and a diode D2 at between pin-C and GND.

This application circuit shows the general example of a circuit, and is not a design guarantee for right operation.

Fig.41 Operations of Shortcircuit Protector Circuit

1. Detection of increase in  $V_{CE(sat)}$  of IGBT due to overcurrent by means of C terminal (pin ⑨)
2. Reduction of the IGBT gate voltage, and suppression of the collector current
3. Simultaneous output of signals to indicate the shortcircuit condition (FS signal) from FS terminal (pin ⑧) to the microcomputer
4. Judgement and processing by the microcomputer
  - In the case of instantaneous shortcircuit, run continues.
  - At fault, input to the photocoupler is cut off, and IGBT is turned OFF.

Remarks : Please be aware that all data in the graph are just for reference and not for guarantee.

## ■ Design Considerations

### ● Notes about static electricity

Transistor of detector side in bipolar configuration may be damaged by static electricity due to its minute design.

When handling these devices, general countermeasure against static electricity should be taken to avoid breakdown of devices or degradation of characteristics.

### ● Design guide

In order to stabilize power supply line, we should certainly recommend to connect a by-pass capacitor of 0.01 $\mu$ F or more between  $V_{CC}$  and GND near the device.

We recommend to use approximately 1 000pF of capacitor between C-pin and GND in order to prevent miss operation by noise.

In the case that capacitor is used approximately 1k $\Omega$  of resistance shall be recommended to use between  $V_{CC}$  and C-pin. However, the rise time of C-pin shall be changed by time constant of added CR, so that please use this device after confirmation.

In case that some sudden big noise caused by voltage variation is provided between primary and secondary terminals of photocoupler some current caused by it is floating capacitance may be generated and result in false operation since current may go through IRED or current may change.

If the photocoupler may be used under the circumstances where noise will be generated we recommend to use the bypass capacitors at the both ends of IRED.

The detector which is used in this device, has parasitic diode between each pins and GND.

There are cases that miss operation or destruction possibly may be occurred if electric potential of any pin becomes below GND level even for instant.

Therefore it shall be recommended to design the circuit that electric potential of any pin does not become below GND level.

This product is not designed against irradiation and incorporates non-coherent IRED.

● **Degradation**

In general, the emission of the IRED used in photocouplers will degrade over time.

In the case of long term operation, please take the general IRED degradation (50% degradation over 5years) into the design consideration.

Please decide the input current which become 2times of MAX.  $I_{FLH}$ .

● **Recommended Foot Print (reference)**

(Unit : mm)

☆ For additional design assistance, please review our corresponding Optoelectronic Application Notes.

## ■ Manufacturing Guidelines

### ● Soldering Method

#### Reflow Soldering:

Reflow soldering should follow the temperature profile shown below.  
Soldering should not exceed the curve of temperature profile and time.  
Please don't solder more than twice.

#### Flow Soldering :

Due to SHARP's double transfer mold construction submersion in flow solder bath is allowed under the below listed guidelines.

Flow soldering should be completed below 260°C and within 10s.  
Preheating is within the bounds of 100 to 150°C and 30 to 80s.  
Please don't solder more than twice.

#### Hand soldering

Hand soldering should be completed within 3s when the point of solder iron is below 400°C.  
Please don't solder more than twice.

#### Other notices

Please test the soldering method in actual condition and make sure the soldering works fine, since the impact on the junction between the device and PCB varies depending on the tooling and soldering conditions.

**● Cleaning instructions****Solvent cleaning:**

Solvent temperature should be 45°C or below Immersion time should be 3minutes or less

**Ultrasonic cleaning:**

The impact on the device varies depending on the size of the cleaning bath, ultrasonic output, cleaning time, size of PCB and mounting method of the device.

Therefore, please make sure the device withstands the ultrasonic cleaning in actual conditions in advance of mass production.

**Recommended solvent materials:**

Ethyl alcohol, Methyl alcohol and Isopropyl alcohol

In case the other type of solvent materials are intended to be used, please make sure they work fine in actual using conditions since some materials may erode the packaging resin.

**● Presence of ODC**

This product shall not contain the following materials.

And they are not used in the production process for this device.

Regulation substances : CFCs, Halon, Carbon tetrachloride, 1.1.1-Trichloroethane (Methylchloroform)

Specific brominated flame retardants such as the PBBOs and PBBs are not used in this product at all.

**■ Package specification****● Sleeve package**

## Package materials

Sleeve : HIPS (with anti-static material)

Stopper : Styrene-Elastomer

## Package method

MAX. 50 pcs. of products shall be packaged in a sleeve.

Both ends shall be closed by tabbed and tabless stoppers.

The product shall be arranged in the sleeve with its primary side mark on the tabless stopper side.

MAX. 20 sleeves in one case.

## Sleeve outline dimensions

## ■ Important Notices

· The circuit application examples in this publication are provided to explain representative applications of SHARP devices and are not intended to guarantee any circuit design or license any intellectual property rights. SHARP takes no responsibility for any problems related to any intellectual property right of a third party resulting from the use of SHARP's devices.

· Contact SHARP in order to obtain the latest device specification sheets before using any SHARP device. SHARP reserves the right to make changes in the specifications, characteristics, data, materials, structure, and other contents described herein at any time without notice in order to improve design or reliability. Manufacturing locations are also subject to change without notice.

· Observe the following points when using any devices in this publication. SHARP takes no responsibility for damage caused by improper use of the devices which does not meet the conditions and absolute maximum ratings to be used specified in the relevant specification sheet nor meet the following conditions:

(i) The devices in this publication are designed for use in general electronic equipment designs such as:

- Personal computers
- Office automation equipment
- Telecommunication equipment [terminal]
- Test and measurement equipment
- Industrial control
- Audio visual equipment
- Consumer electronics

(ii) Measures such as fail-safe function and redundant design should be taken to ensure reliability and safety when SHARP devices are used for or in connection

with equipment that requires higher reliability such as:

- Transportation control and safety equipment (i.e., aircraft, trains, automobiles, etc.)
- Traffic signals
- Gas leakage sensor breakers
- Alarm equipment
- Various safety devices, etc.

(iii) SHARP devices shall not be used for or in connection with equipment that requires an extremely high level of reliability and safety such as:

- Space applications
- Telecommunication equipment [trunk lines]
- Nuclear power control equipment
- Medical and other life support equipment (e.g., scuba).

· If the SHARP devices listed in this publication fall within the scope of strategic products described in the Foreign Exchange and Foreign Trade Law of Japan, it is necessary to obtain approval to export such SHARP devices.

· This publication is the proprietary product of SHARP and is copyrighted, with all rights reserved. Under the copyright laws, no part of this publication may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose, in whole or in part, without the express written permission of SHARP. Express written permission is also required before any use of this publication may be made by a third party.

· Contact and consult with a SHARP representative if there are any questions about the contents of this publication.
