Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

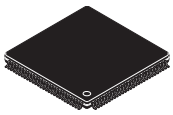
Document Number: MCF52277
Rev. 8, 09/2009

MCF52277



LQFP–176
24 mm x 24 mm

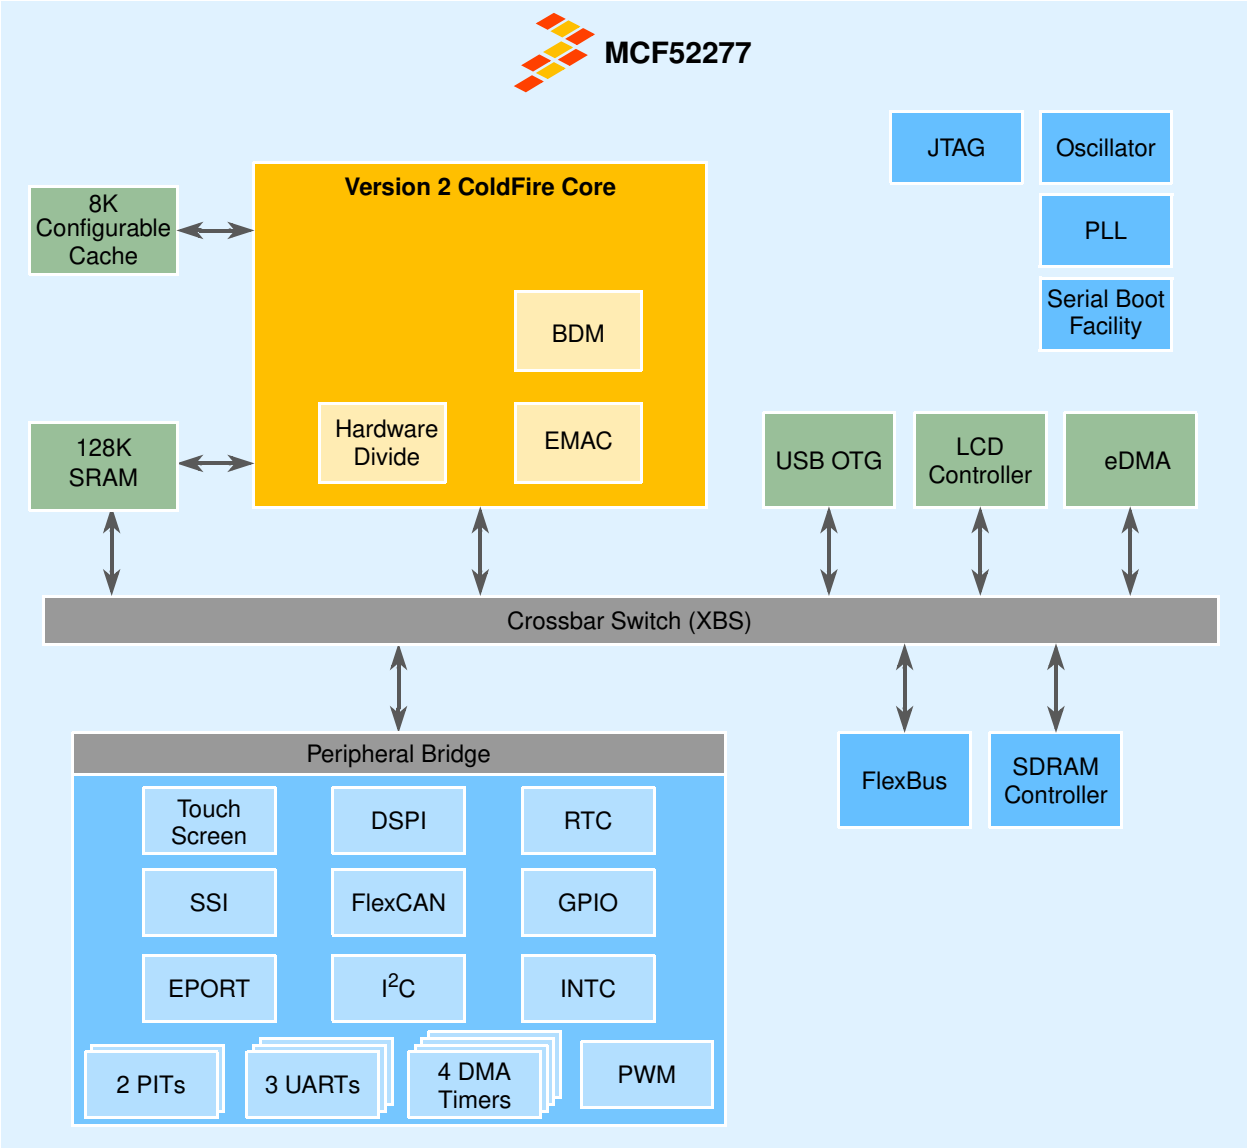
MAPBGA–196
15mm x 15mm

MCF5227*x* ColdFire® Microprocessor Data Sheet

Features

- Version 2 ColdFire® Core with EMAC
- Up to 159 Dhrystone 2.1 MIPS @ 166.67 MHz
- 8 Kbytes configurable cache (instruction only, data only, or split instruction/data)
- 128 Kbytes internal SRAM
- Support for booting from SPI-compatible flash, EEPROM, and FRAM devices
- Crossbar switch technology (XBS) for concurrent access to peripherals or RAM from multiple bus masters
- 16 channel DMA controller
- 16- or 32-bit SDR/DDR controller
- USB 2.0 On-the-Go controller
- Liquid crystal display controller with support up to 800 × 600 pixels
- ADC and touchscreen controller
- FlexCAN module
- 4 32-bit timers with DMA support
- DMA supported serial peripheral interface (DSPI)
- 3 UARTs
- I^2C bus interface
- Synchronous serial interface (SSI)
- Plus-width modulator (PWM)
- Real-time clock (RTC)
- Two programmable interrupt controllers (PIT)

Table of Contents



LEGEND

BDM	– Background debug module	**LCD**	– Liquid-crystal display
DSPI	– DMA serial peripheral interface	**PIT**	– Programmable interrupt timer
eDMA	– Enhanced direct memory access	**PLL**	– Phase-locked loop module
EMAC	– Enchanced multiply-accumulate unit	**PWM**	– Pulse-width modulator
EPORT	– Edge port module	**RTC**	– Real time clock
GPIO	– General purpose input/output module	**SSI**	– Synchronous serial interface
I^2C	– Inter-intergrated circuit	**UART**	– Universal asynchronous receiver/transmitter
INTC	– Interrupt controller	**USB OTG**	– Universal Serial Bus On-the-Go controller
JTAG	– Joint Test Action Group interface		

Figure 1. MCF52277 Block Diagram

1 MCF5227x Family Comparison

The following table compares the various device derivatives available within the MCF5227*x* family.

Table 1. MCF5227*x* Family Configurations

Module	MCF52274	MCF52277
ColdFire Version 2 Core with EMAC (Enhanced Multiply-Accumulate Unit)	•	•
Core (System) Clock	up to 120 MHz	up to 166.67 MHz
Peripheral and External Bus Clock (Core clock ÷ 2)	up to 60 MHz	up to 83.33 MHz
Performance (Dhrystone/2.1 MIPS)	up to 114	up to 159
Static RAM (SRAM)	128 Kbytes	
Configurable Cache	8 Kbytes	
ASP Touchscreen Controller	•	•
LCD Controller	12-bit color	18-bit color
USB 2.0 On-the-Go	•	•
FlexBus External Interface	•	•
SDR/DDR SDRAM Controller	•	•
FlexCAN 2.0B communication module	•	•
Real Time Clock	•	•
Watchdog Timer	•	•
16-channel Direct Memory Access (DMA)	•	•
Interrupt Controllers (INTC)	1	1
Synchronous Serial Interface (SSI)	•	•
I^2C	•	•
DSPI	•	•
UARTs	3	3
32-bit DMA Timers	4	4
Periodic Interrupt Timers (PIT)	2	2
PWM Module	•	•
Edge Port Module (EPORT)	•	•
General Purpose I/O Module (GPIO)	•	•
JTAG - IEEE® 1149.1 Test Access Port	•	•
Package	176 LQFP	196 MAPBGA

2 Ordering Information

Table 2. Orderable Part Numbers

Freescale Part Number	Description	Package	Speed	Temperature
MCF52274CLU120	MCF52274 RISC Microprocessor	176 LQFP	120 MHz	–40° to +85° C
MCF52277CVM160	MCF52277 RISC Microprocessor	196 MAPBGA	166.67 MHz	–40° to +85° C

3 Hardware Design Considerations

3.1 PLL Power Filtering

To further enhance noise isolation, an external filter is strongly recommended for PLL analog V_{DD} pins. The filter shown in Figure 2 should be connected between the board V_{DD} and the $PLLV_{DD}$ pins. The resistor and capacitors should be placed as close to the dedicated $PLLV_{DD}$ pin as possible.

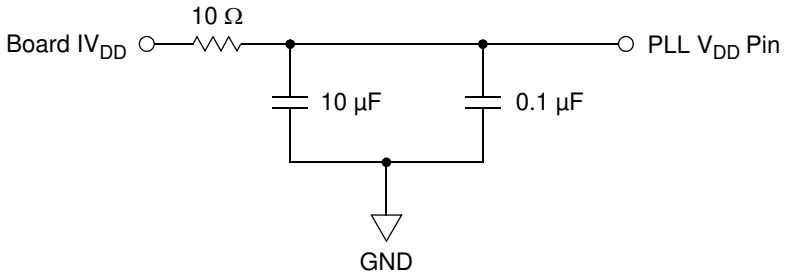


Figure 2. System PLL V_{DD} Power Filter

3.2 USB Power Filtering

To minimize noise, external filters are required for each of the USB power pins. The filter shown in Figure 3 should be connected between the board EV_{DD} and the $USBV_{DD}$ pin. The resistor and capacitors should be placed as close to the dedicated $USBV_{DD}$ pin as possible.

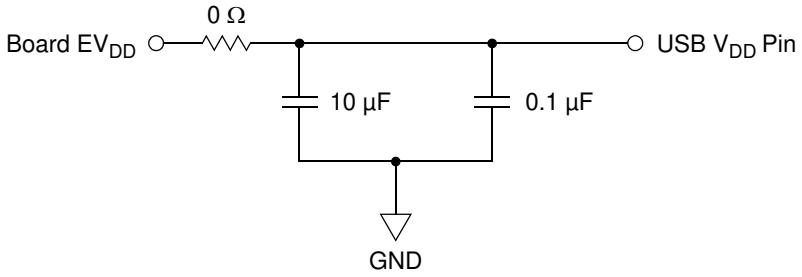

Figure 3. USB V_{DD} Power Filter

NOTE

In addition to the above filter circuitry, a 0.01 F capacitor is also recommended in parallel with those shown.

3.3 ADC Power Filtering

To minimize noise, an external filters is required for the $ADCV_{DD}$ power pin. The filter shown in Figure 4 should be connected between the board EV_{DD} and the $ADCV_{DD}$ pin. The resistor and capacitors should be placed as close to the dedicated $ADCV_{DD}$ pin as possible.

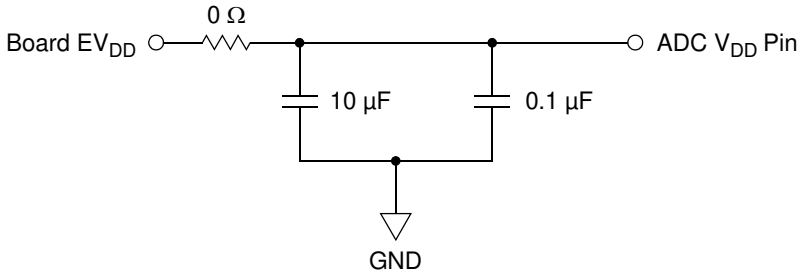

Figure 4. ADC V_{DD} Power Filter

3.4 Supply Voltage Sequencing

The relationship between SDV_{DD} and EV_{DD} is non-critical during power-up and power-down sequences. Both SDV_{DD} (2.5V or 3.3V) and EV_{DD} are specified relative to IV_{DD}.

3.4.1 Power Up Sequence

If EV_{DD}/SDV_{DD} are powered up with IV_{DD} at 0 V, then the sense circuits in the I/O pads will cause all pad output drivers connected to the EV_{DD}/SDV_{DD} to be in a high impedance state. There is no limit on how long after EV_{DD}/SDV_{DD} powers up before IV_{DD} must powered up. IV_{DD} should not lead the EV_{DD}, SDV_{DD} or $PLLV_{DD}$ by more than 0.4 V during power ramp-up, or there will be high current in the internal ESD protection diodes. The rise times on the power supplies should be slower than 500 us to avoid turning on the internal ESD protection clamp diodes.

3.4.2 Power Down Sequence

If $IV_{DD}/PLLV_{DD}$ are powered down first, then sense circuits in the I/O pads will cause all output drivers to be in a high impedance state. There is no limit on how long after IV_{DD} and $PLLV_{DD}$ power down before EV_{DD} or SDV_{DD} must power down. IV_{DD} should not lag EV_{DD}, SDV_{DD}, or $PLLV_{DD}$ going low by more than 0.4 V during power down or there will be undesired high current in the ESD protection diodes. There are no requirements for the fall times of the power supplies.

The recommended power down sequence is as follows:

1. Drop $IV_{DD}/PLLV_{DD}$ to 0 V.
2. Drop EV_{DD}/SDV_{DD} supplies.

3.5 Power Consumption Specifications

All application power consumption data is lab data measured on an M52277EVB running the Freescale Linux BSP.

Table 3. MCF52277 Application Power Consumption[1]

Core Freq.		Idle (LCD image)	Idle (audio image)	Button Demo	Slideshow Demo	MP3 Playback	USB FS File Copy	Units
160 MHz	IV_{DD}	61.4	59.2	84.7	96.5	89.2	89.5	mA
	EV_{DD}	28.87	25.73	35.3	34.6	33.46	29.86	
	SDV_{DD}	18.8	18.57	21.8	23.9	22.66	22.2	
	Total Power	**221.211**	**207.135**	**282.78**	**301.95**	**285.006**	**272.748**	**mW**

1 All voltage rails at nominal values: IV_{DD} = 1.5 V, EV_{DD} = 3.3 V, and SDV_{DD} = 1.8 V.

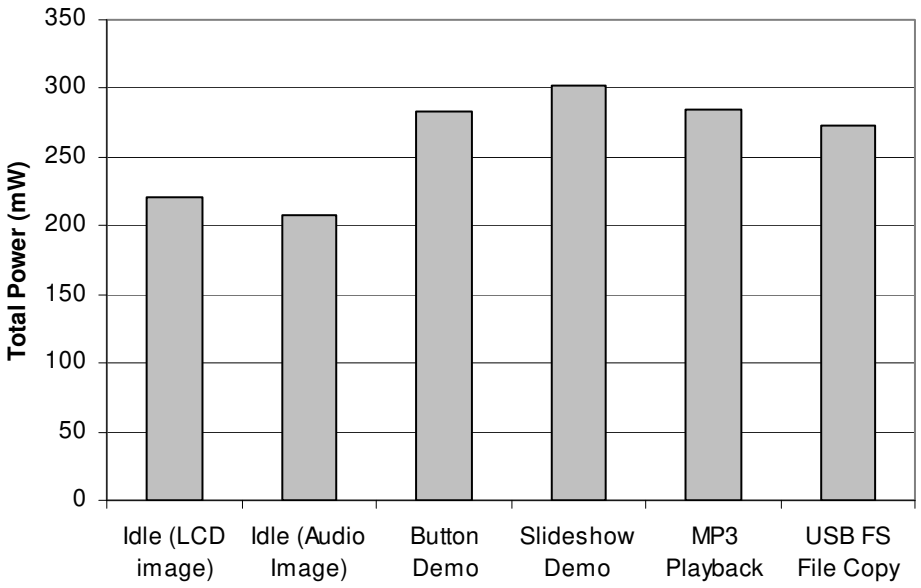

Figure 5. Power Consumption in Various Applications

All current consumption data is lab data measured on a single device using an evaluation board. Table 4 shows the typical power consumption in low-power modes. These current measurements are taken after executing a STOP instruction.

Table 4. Current Consumption in Low-Power Modes[1,2]

Mode	Voltage Supply	System Frequency				
		80MHz	64MHz	48MHz	32MHz	4MHz (LIMP mode)
RUN	IV_{DD} (mA)	75.1	62.7	49.2	36.6	3.5
	Power (mW)	112.65	94.05	73.80	54.90	5.25
WAIT	IV_{DD} (mA)	61.9	52.8	42.0	31.7	2.9
	Power (mW)	92.85	79.20	63.00	47.55	4.35

Table 4. Current Consumption in Low-Power Modes[1,2] (continued)

Mode	Voltage Supply	System Frequency				
		80MHz	64MHz	48MHz	32MHz	4MHz (LIMP mode)
DOZE	IV_{DD} (mA)	57.0	48.8	38.9	29.7	2.7
	Power (mW)	85.50	73.20	58.35	44.55	4.05
STOP 0	IV_{DD} (mA)	16.1	15.1	13.4	12.5	1.3
	Power (mW)	24.15	22.65	20.10	18.75	1.95
STOP 1	IV_{DD} (mA)	15.9	14.9	13.2	12.4	1.3
	Power (mW)	23.85	22.35	19.80	18.60	1.95
STOP 2	IV_{DD} (mA)	1.8	1.8	1.8	1.8	1.3
	Power (mW)	2.70	2.70	2.70	2.70	1.95
STOP 3	IV_{DD} (mA)	0.5	0.5	0.5	0.5	0.5
	Power (mW)	0.75	0.75	0.75	0.75	0.75

1 All values are measured on an M52277EVB with nominal core voltage(IV_{DD} = 1.5 V). Tests performed at room temperature. All peripheral clocks on prior to entering low-power mode

2 Refer to the Power Management chapter in the *MCF52277 Reference Manual* for more information on low-power modes.

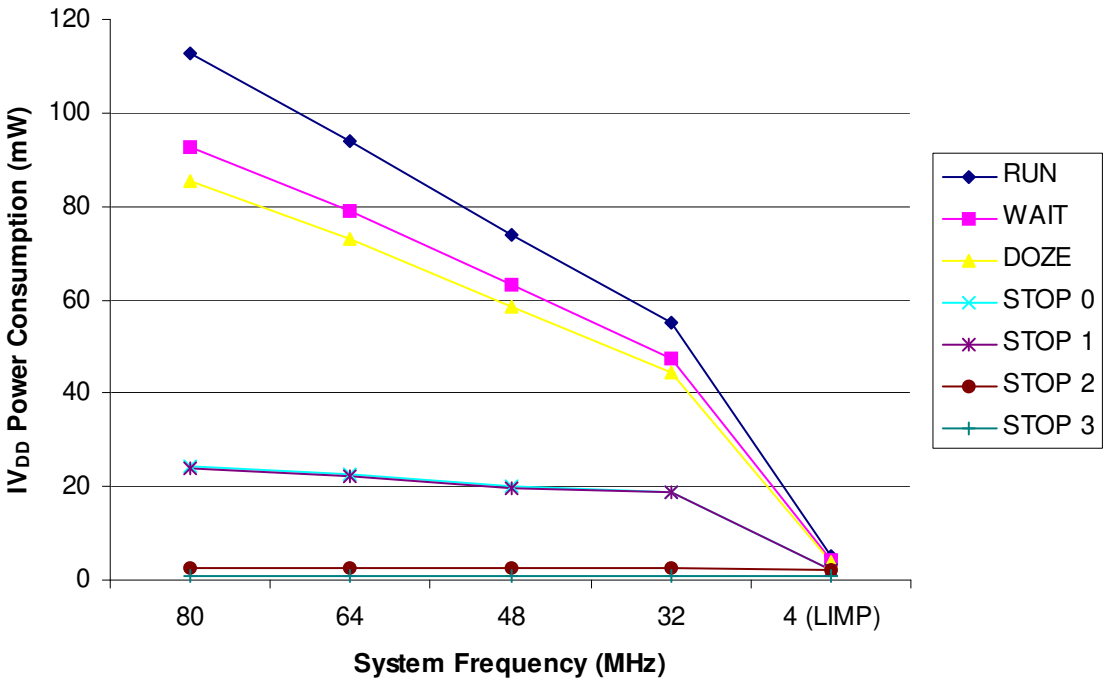

Figure 6. IV_{DD} Power Consumption in Low-Power Modes

4 Pin Assignments and Reset States

4.1 Signal Multiplexing

The following table lists all the MCF5227*x* pins grouped by function. The direction column is the direction for the primary function of the pin only. Refer to Section 4, "Pin Assignments and Reset States," for package diagrams. For a more detailed discussion of the MCF5227*x* signals, consult the *MCF52277 Reference Manual* (MCF52277RM).

NOTE

In this table and throughout this document a single signal within a group is designated without square brackets (i.e., FB_A23), while designations for multiple signals within a group use brackets (i.e., FB_A[23:21]) and is meant to include all signals within the two bracketed numbers when these numbers are separated by a colon.

NOTE

The primary functionality of a pin is not necessarily its default functionality. Most pins that are muxed with GPIO will default to their GPIO functionality. See Table 5 for a list of the exceptions.

Table 5. Special-Case Default Signal Functionality

1 Pull-ups are generally only enabled on pins with their primary function, except as noted.

2 Refers to pin's primary function.

3 Enabled only in oscillator bypass mode (internal crystal oscillator is disabled).

4 GPIO functionality is determined by the edge port module. The GPIO module is only responsible for assigning the alternate functions.

5 Pull-up when $\overline{\text{DREQ}}$ controls the pin.

6 The 176 LQFP device only supports a 12-bit LCD data bus.

7 DSPI or SBF signal functionality is controlled by $\overline{\text{RESET}}$. When asserted, these pins are configured for serial boot; when negated, the pins are configured for DSPI.

8 Pull-up when the serial boot facility (SBF) controls the pin.

9 If JTAG_EN is asserted, these pins default to alternate 1 (JTAG) functionality. The GPIO module is not responsible for assigning these pins.

4.2 Pinout—176 LQFP

The pinout for the MCF52274 package is shown below.

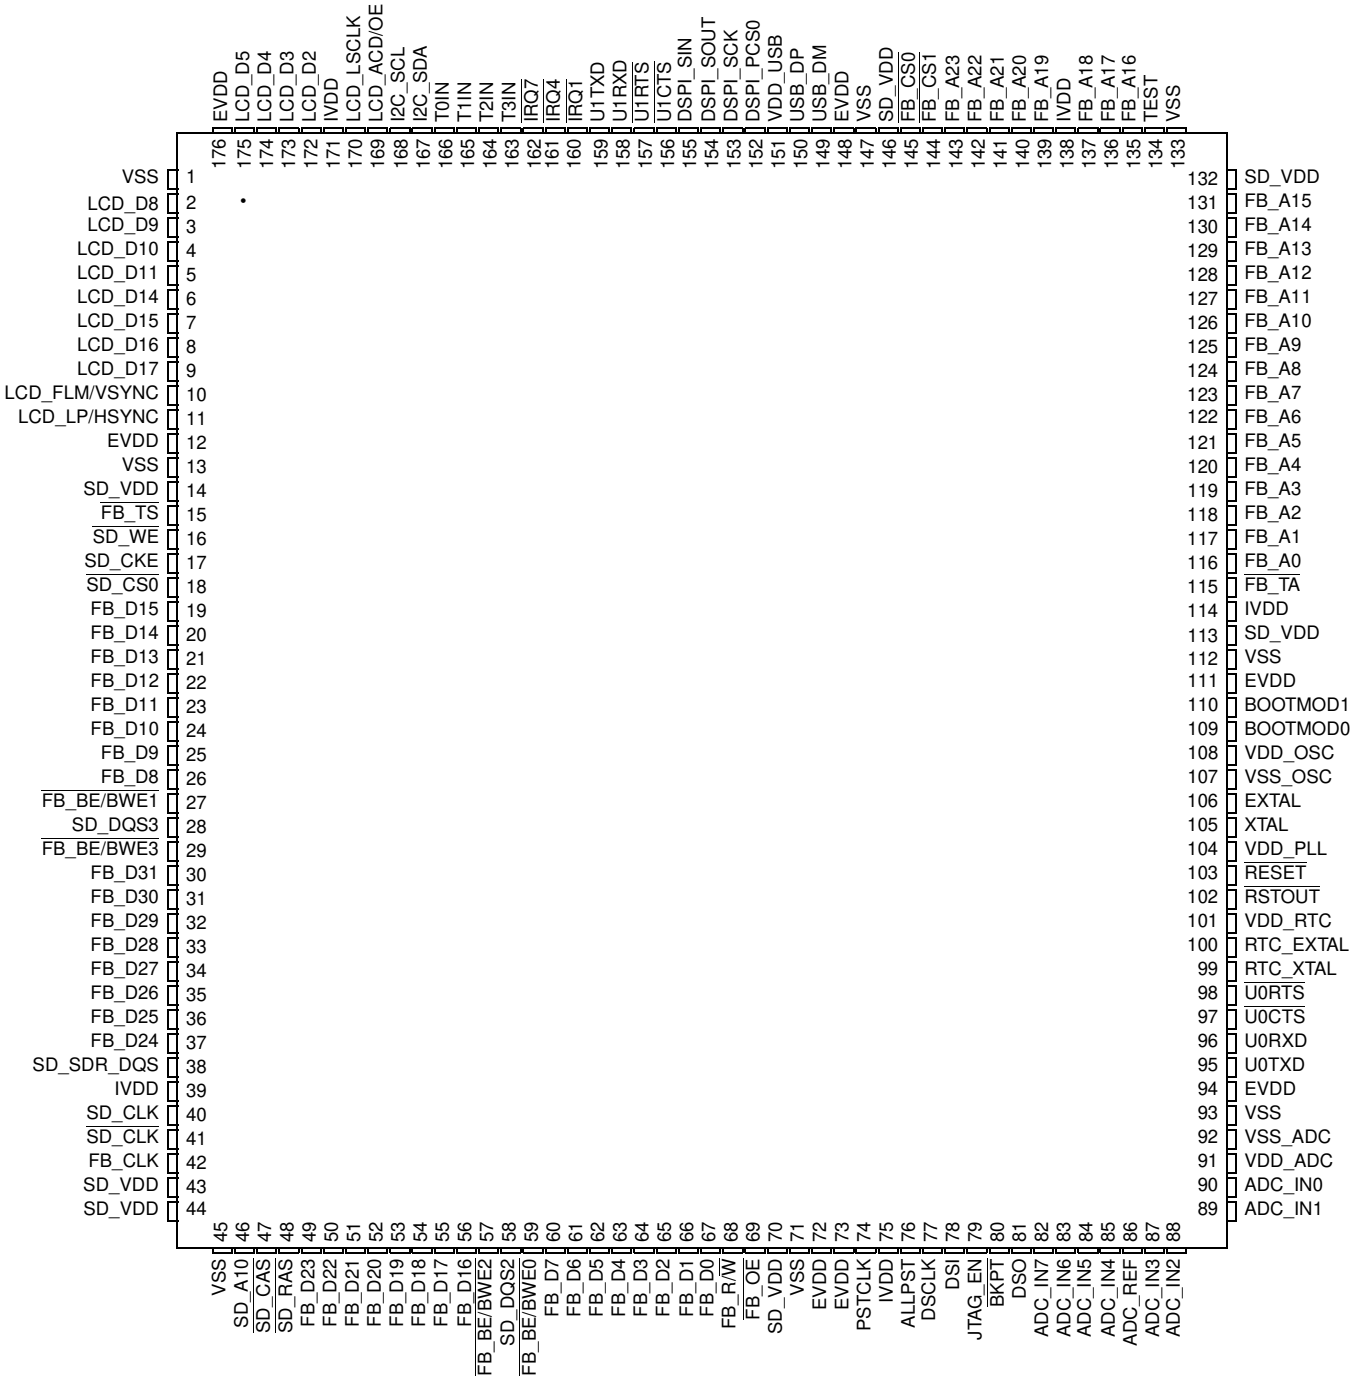

Figure 7. MCF52274 Pinout (176 LQFP)

5 Electrical Characteristics

This document contains electrical specification tables and reference timing diagrams for the MCF5227x microprocessor. This section contains detailed information on DC/AC electrical characteristics and AC timing specifications.

The electrical specifications are preliminary and are from previous designs or design simulations. These specifications may not be fully tested or guaranteed at this early stage of the product life cycle, however for production silicon these specifications will be met. Finalized specifications will be published after complete characterization and device qualifications have been completed.

NOTE

The parameters specified in this MCU document supersede any values found in the module specifications.

5.1 Maximum Ratings

Table 7. Absolute Maximum Ratings[1, 2]

Characteristic	Symbol	Value	Unit
Core Supply Voltage	IV_{DD}	–0.5 to +2.0	V
CMOS Pad Supply Voltage	EV_{DD}	–0.3 to +4.0	V
DDR/Memory Pad Supply Voltage	SDV_{DD}	–0.3 to +4.0	V
Oscillator Supply Voltage	$OSCV_{DD}$	–0.3 to +4.0	V
PLL Supply Voltage	$PLLV_{DD}$	–0.3 to +2.0	V
RTC Supply Voltage	$RTCV_{DD}$	–0.5 to +2.0	V
Digital Input Voltage [3]	V_{IN}	–0.3 to +3.6	V
Instantaneous Maximum Current Single pin limit (applies to all pins) [3, 4, 5]	I_D	25	mA
Operating Temperature Range (Packaged)	T_A (T_L – T_H)	–40 to +85	°C
Storage Temperature Range	T_{stg}	–55 to +150	°C

1 Functional operating conditions are given in Section 5.4, “DC Electrical Specifications.” Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Continued operation at these levels may affect device reliability or cause permanent damage to the device.

2 This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (e.g., either V_{SS} or EV_{DD}).

3 Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

4 All functional non-supply pins are internally clamped to V_{SS} and EV_{DD}.

5 Power supply must maintain regulation within operating EV_{DD} range during instantaneous and operating maximum current conditions. If positive injection current (V_{in} > EV_{DD}) is greater than I_{DD}, the injection current may flow out of EV_{DD} and could result in external power supply going out of regulation. Insure external EV_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power (ex; no clock). Power supply must maintain regulation within operating EV_{DD} range during instantaneous and operating maximum current conditions.

5.2 Thermal Characteristics

Table 8. Thermal Characteristics

Characteristic		Symbol	196 MAPBGA	176 LQFP	Unit
Junction to ambient, natural convection	Four layer board (2s2p)	θ_{JA}	38[1,2]	48[1,2]	°C/W
Junction to ambient (@200 ft/min)	Four layer board (2s2p)	θ_{JMA}	34[1,2]	42[1,2]	°C/W
Junction to board		θ_{JB}	27[3]	37[3]	°C/W
Junction to case		θ_{JC}	17[4]	14[4]	°C/W
Junction to top of package		Ψ_{jt}	4[1,5]	3[1,5]	°C/W
Maximum operating junction temperature		T_j	105	105	°C

1 θ_{JA}, θ_{JMA} and Ψ_{jt} parameters are simulated in conformance with EIA/JESD Standard 51-2 for natural convection. Freescale recommends the use of θ_{JmA} and power dissipation specifications in the system design to prevent device junction temperatures from exceeding the rated specification. System designers should be aware that device junction temperatures can be significantly influenced by board layout and surrounding devices. Conformance to the device junction temperature specification can be verified by physical measurement in the customer's system using the Ψ_{jt} parameter, the device power dissipation, and the method described in EIA/JESD Standard 51-2.

2 Per JEDEC JESD51-6 with the board horizontal.

3 Thermal resistance between the die and the printed circuit board in conformance with JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

4 Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

5 Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written in conformance with Psi-JT.

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \times \Theta_{JMA}) \quad \textbf{Eqn. 1}$$

Where:

T_A = Ambient Temperature, °C
Q_{JMA} = Package Thermal Resistance, Junction-to-Ambient, °C/W
P_D = $P_{INT} + P_{I/O}$
P_{INT} = $I_{DD} \times IV_{DD}$, Watts – Chip Internal Power
$P_{I/O}$ = Power Dissipation on Input and Output Pins — User Determined

For most applications $P_{I/O} < P_{INT}$ and can be ignored. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = \frac{K}{(T_J + 273\,°C)} \quad \textbf{Eqn. 2}$$

Solving equations 1 and 2 for K gives:

$$K = P_D \times (T_A \times 273°C) + Q_{JMA} \times P_D^2 \quad \textbf{Eqn. 3}$$

where K is a constant pertaining to the particular part. K can be determined from Equation 3 by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J can be obtained by solving Equation 1 and Equation 2 iteratively for any value of T_A.

5.3 ESD Protection

Table 9. ESD Protection Characteristics[1,2]

Characteristic	Symbol	Value	Unit
ESD Target for Human Body Model	HBM	2000	V

1 All ESD testing is in conformity with CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits.

2 A device is defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing is performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

5.4 DC Electrical Specifications

Table 10. DC Electrical Specifications

Characteristic	Symbol	Min	Max	Unit
Core Supply Voltage	IV_{DD}	1.4	1.6	V
PLL Supply Voltage	$PLLV_{DD}$	1.4	1.6	V
RTC Supply Voltage	$RTCV_{DD}$	1.4	1.6	V
CMOS Pad Supply Voltage	EV_{DD}	3.0	3.6	V
SDRAM and FlexBus Supply Voltage Mobile DDR/Bus Pad Supply Voltage (nominal 1.8V) DDR/Bus Pad Supply Voltage (nominal 2.5V) SDR/Bus Pad Supply Voltage (nominal 3.3V)	SDV_{DD}	 1.7 2.25 3.0	 1.95 2.75 3.6	V
USB Supply Voltage	$USBV_{DD}$	3.0	3.6	V
Oscillator Supply Voltage	$OSCV_{DD}$	3.0	3.6	V
CMOS Input High Voltage	EV_{IH}	2	EV_{DD} + 0.3	V
CMOS Input Low Voltage	EV_{IL}	V_{SS} – 0.3	0.8	V
CMOS Output High Voltage I_{OH} = –5.0 mA	EV_{OH}	EV_{DD} – 0.4	—	V
CMOS Output Low Voltage I_{OL} = 5.0 mA	EV_{OL}	—	0.4	V
SDRAM and FlexBus Input High Voltage Mobile DDR/Bus Input High Voltage (nominal 1.8V) DDR/Bus Pad Supply Voltage (nominal 2.5V) SDR/Bus Pad Supply Voltage (nominal 3.3V)	SDV_{IH}	 1.35 1.7 2	 SDV_{DD} + 0.3 SDV_{DD} + 0.3 SDV_{DD} + 0.3	V
SDRAM and FlexBus Input Low Voltage Mobile DDR/Bus Input High Voltage (nominal 1.8V) DDR/Bus Pad Supply Voltage (nominal 2.5V) SDR/Bus Pad Supply Voltage (nominal 3.3V)	SDV_{IL}	 V_{SS} – 0.3 V_{SS} – 0.3 V_{SS} – 0.3	 0.45 0.8 0.8	V

Table 10. DC Electrical Specifications (continued)

Characteristic	Symbol	Min	Max	Unit
SDRAM and FlexBus Output High Voltage Mobile DDR/Bus Input High Voltage (nominal 1.8V) DDR/Bus Pad Supply Voltage (nominal 2.5V) SDR/Bus Pad Supply Voltage (nominal 3.3V) I_{OH} = –5.0 mA for all modes	SDV_{OH}	 1.4 2.1 2.4	 — — —	V
SDRAM and FlexBus Output Low Voltage Mobile DDR/Bus Input High Voltage (nominal 1.8V) DDR/Bus Pad Supply Voltage (nominal 2.5V) SDR/Bus Pad Supply Voltage (nominal 3.3V) I_{OL} = 5.0 mA for all modes	SDV_{OL}	 — — —	 0.3 0.3 0.5	V
Input Leakage Current V_{in} = V_{DD} or V_{SS}, Input-only pins	I_{in}	–1.0	1.0	µA
Weak Internal Pull-Up Device Current, tested at V_{IL} Max.[1]	I_{APU}	–10	–130	µA
Input Capacitance [2] All input-only pins All input/output (three-state) pins	C_{in}	 — —	 7 7	pF

1 Refer to the signals section for pins having weak internal pull-up devices.

2 This parameter is characterized before qualification rather than 100% tested.

5.5 Oscillator and PLL Electrical Characteristics

Table 11. PLL Electrical Characteristics

Num	Characteristic	Symbol	Min	Max	Unit
1	PLL Reference Frequency Range Crystal reference External reference	 $f_{ref\_crystal}$ f_{ref_ext}	 16 16	 25[1] 66.67[1]	 MHz MHz
2	Core/system frequency CLKOUT Frequency	f_{sys} $f_{sys/2}$	512 Hz[2] 256 Hz[2]	166.67 83.33	MHz MHz
3	Crystal Start-up Time[3,4]	t_{cst}	—	10	ms
4	EXTAL Input High Voltage Crystal Mode[5] All other modes (External, Limp)	 V_{IHEXT} V_{IHEXT}	 V_{XTAL} + 0.4 E_{VDD}/2 + 0.4	 — —	 V V
5	EXTAL Input Low Voltage Crystal Mode[5] All other modes (External, Limp)	 V_{ILEXT} V_{ILEXT}	 — —	 V_{XTAL} – 0.4 E_{VDD}/2 – 0.4	 V V
7	PLL Lock Time [3,6]	t_{lpll}	—	50000	CLKIN
8	Duty cycle of reference[3]	t_{dc}	40	60	%
9	XTAL Current	I_{XTAL}	1	3	mA
10	Total on-chip stray capacitance on XTAL	C_{S_XTAL}	—	1.5	pF
11	Total on-chip stray capacitance on EXTAL	C_{S_EXTAL}	—	1.5	pF
12	Crystal capacitive load	C_L	See crystal spec		

Table 11. PLL Electrical Characteristics (continued)

Num	Characteristic	Symbol	Min	Max	Unit
13	Discrete load capacitance for XTAL Discrete load capacitance for EXTAL	C_{L_XTAL} C_{L_EXTAL}	—	$2 \times (C_L - C_{S\_XTAL} - C_{S\_EXTAL} - C_{S\_PCB})$[7]	pF
14	Frequency un-LOCK Range	f_{UL}	–4.0	4.0	% f_{sys}
15	Frequency LOCK Range	f_{LCK}	–2.0	2.0	% f_{sys}
17	CLKOUT period jitter [4, 5, 8] measured at f_{sys} max Peak-to-peak jitter (Clock edge to clock edge) Long-term jitter	C_{jitter}	 — —	 10 TBD	 % $f_{sys/2}$ % $f_{sys/2}$
19	VCO frequency ($f_{vco} = f_{ref} \times$ PFDR)	f_{vco}	350	540	MHz

1 Although these are the allowable frequency ranges, do not violate the VCO frequency range of the PLL. See the *MCF5227x Reference Manual* for more details.

2 The minimum system frequency is the minimum input clock divided by the maximum low-power divider (16 MHz ÷ 32,768). When the PLL is enabled, the minimum system frequency (f_{sys}) is 37.5 MHz.

3 This parameter is guaranteed by characterization before qualification rather than 100% tested. Applies to external clock reference only.

4 Proper PC board layout procedures must be followed to achieve specifications.

5 This parameter is guaranteed by design rather than 100% tested.

6 This specification is the PLL lock time only and does not include oscillator start-up time..

7 C_{S_PCB} is the measured PCB stray capacitance on EXTAL and XTAL.

8 Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{sys}. Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the PLL circuitry via PLL V_{DD}, EV_{DD}, and V_{SS} and variation in crystal oscillator frequency increase the Cjitter percentage for a given interval.

5.6 ASP Electrical Characteristics

Table 12 lists the electrical specifications for the ASP module.

Table 12. ASP Electrical Characteristics

Characteristic	Symbol	Min	Typical	Max	Unit
ASP Analog Supply Voltage	V_{DDA}	3.0	—	3.6	V
Input Voltage Range	V_{ADIN}	0	—	V_{DDA}	V
Operating Current Consumption	I_{DDA_ON}	—	700	—	uA
Power-down Current Consumption	I_{DDA_OFF}	—	1	—	uA
Resolution	R_{ES}	—	—	12	bits
Sampling rate		—	—	125	kS/s
Integral Non-linearity	INL	—	±8	±24	lsb[1]
Differential Non-linearity	DNL	—	±2	±24	lsb[1]
ADC Internal Clock Frequency	t_{AIC}	2	—	8	MHz
Conversion Range	R_{AD}	0	—	V_{DDA}	V

Table 12. ASP Electrical Characteristics (continued)

Characteristic	Symbol	Min	Typical	Max	Unit
Conversion Time	t_{ADC}	15	—	32	t_{AIC} cycles
Sample Time	t_{ADS}	3	—	20	t_{AIC} cycles
Multiplexer Settling Time	t_{AMS}	—	—	3	t_{AIC} cycles
Zero-scale Error	ZE	—	±4	±12	lsb[1]
Full-scale Error	FE	—	±320	±370	lsb[1]
Input Capacitance	C_{AIN}	—	—	34	pF

1 A least significant bit (lsb) is a unit of voltage equal to the smallest resolution of the ADC. This unit of measure approximately relates the error voltage to the observed error in conversion (code error), and is useful for systemic errors such as differential non-linearity. A 2.56-V input on an ADC with ± 3 lsb of error could read between 0x1FD and 0x203. This unit is by far the most common terminology and will be the preferred unit used for error representation.
A bit is a unit equal to the log (base2) of the error voltage normalized to the resolution of the ADC. An error of N bits corresponds to 2^N lsb of error. This measure is easily confused with lsb and is hard to extrapolate between integer values.

5.7 External Interface Timing Specifications

5.7.1 FlexBus

A multi-function external bus interface called FlexBus is provided with basic functionality to interface to slave-only devices up to a maximum bus frequency of 66MHz. It can be directly connected to asynchronous or synchronous devices such as external boot ROMs, flash memories, gate-array logic, or other simple target (slave) devices with little or no additional circuitry. For asynchronous devices a simple chip-select based interface can be used.

All processor bus timings are synchronous; that is, input setup/hold and output delay are given in respect to the rising edge of a reference clock, FB_CLK. The FB_CLK frequency may be the same as the internal system bus frequency or an integer divider of that frequency.

The following timing numbers indicate when data will be latched or driven onto the external bus, relative to the Flexbus output clock, FB_CLK. All other timing relationships can be derived from these values.

Table 13. FlexBus AC Timing Specifications

Num	Characteristic	Symbol	Min	Max	Unit	Notes
	Frequency of Operation		—	83.33	MHz	$f_{sys/2}$
FB1	Clock Period (FB_CLK)	t_{FBCK}	12.0	—	ns	t_{cyc}
FB2	Address, Data, and Control Output Valid (FB_A[23:0], FB_D[31:0], $\overline{\text{FB\_CS}}$[5:0], FB_R/$\overline{\text{W}}$, $\overline{\text{FB\_TS}}$, $\overline{\text{FB\_BE/BWE}}$[3:0] and $\overline{\text{FB\_OE}}$)	$t_{FBCHDCV}$	—	7.0	ns	1
FB3	Address, Data, and Control Output Hold (FB_A[23:0], FB_D[31:0], $\overline{\text{FB\_CS}}$[5:0], FB_R/$\overline{\text{W}}$, $\overline{\text{FB\_TS}}$, $\overline{\text{FB\_BE/BWE}}$[3:0], and $\overline{\text{FB\_OE}}$)	$t_{FBCHDCI}$	1	—	ns	1, 2

Table 13. FlexBus AC Timing Specifications (continued)

Num	Characteristic	Symbol	Min	Max	Unit	Notes
FB4	Data Input Setup	t_{DVFBCH}	3.5	—	ns	
FB5	Data Input Hold	t_{DIFBCH}	0	—	ns	
FB6	Transfer Acknowledge ($\overline{TA}$) Input Setup	t_{CVFBCH}	4	—	ns	
FB7	Transfer Acknowledge ($\overline{TA}$) Input Hold	t_{CIFBCH}	0	—	ns	

1 Timing for chip selects only applies to the $\overline{FB\_CS}$[5:0] signals. Please see Section 5.7.2.2, "DDR SDRAM AC Timing Specifications," for SD_CS[3:0] timing.

2 The FlexBus supports programming an extension of the address hold. Please consult the device reference manual for more information.

NOTE

The processor drives the data lines during the first clock cycle of the transfer with the full 32-bit address. This may be ignored by standard connected devices using non-multiplexed address and data buses. However, some applications may find this feature beneficial.

The address and data busses are muxed between the FlexBus and SDRAM controller. At the end of the read and write bus cycles the address signals are indeterminate.

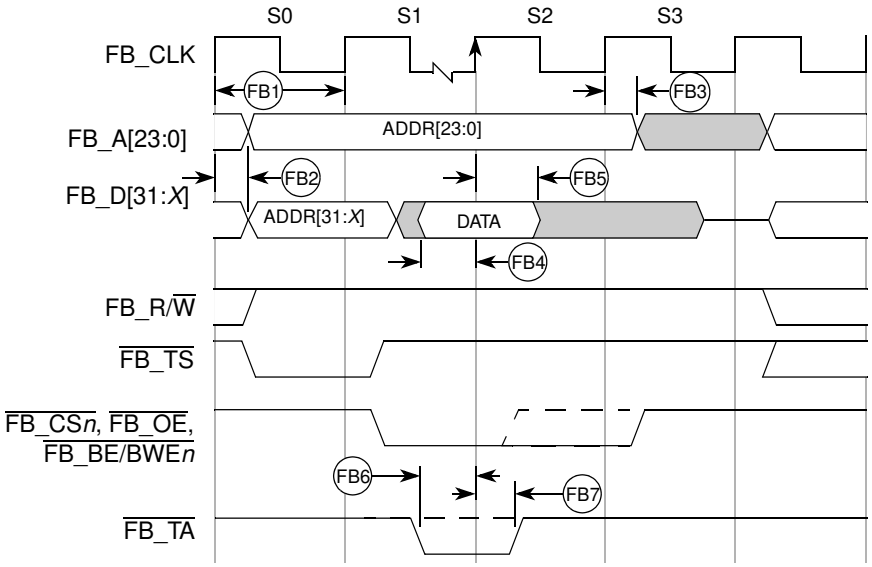

Figure 9. FlexBus Read Timing

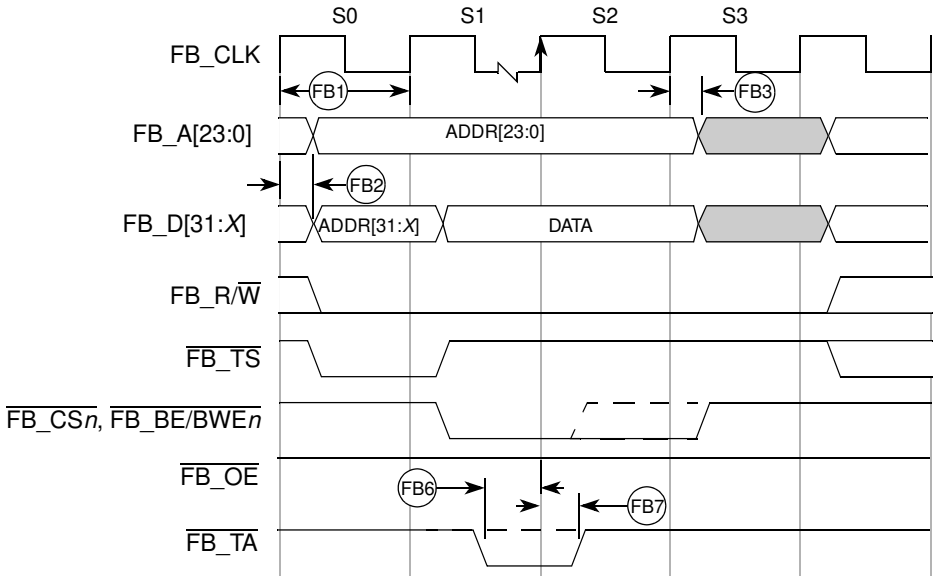

Figure 10. Flexbus Write Timing

5.7.2 SDRAM Bus

The SDRAM controller supports accesses to main SDRAM memory from any internal master. It supports either standard SDRAM or double data rate (DDR) SDRAM, but it does not support both at the same time.

5.7.2.1 SDR SDRAM AC Timing Specifications

The following timing numbers indicate when data will be latched or driven onto the external bus, relative to the memory bus clock, when operating in SDR mode on write cycles and relative to SD_DQS on read cycles. The device's SDRAM controller is a DDR controller that has an SDR mode. Because it is designed to support DDR, a DQS pulse must still be supplied to the device for each data beat of an SDR read. The processor accomplishes this by asserting a signal named SD_SDR_DQS during read cycles. Care must be taken during board design to adhere to the following guidelines and specs with regard to the SD_SDR_DQS signal and its usage.

Table 14. SDR Timing Specifications

Num	Characteristic	Symbol	Min	Max	Unit	Notes
	Frequency of Operation		60	83.33	MHz	1
SD1	Clock Period	t_{SDCK}	12.0	16.67	ns	2
SD2	Pulse Width High	t_{SDCKH}	0.45	0.55	SD_CLK	3
SD3	Pulse Width Low	t_{SDCKH}	0.45	0.55	SD_CLK	3
SD4	Address, SD_CKE, $\overline{\text{SD\_CAS}}$, $\overline{\text{SD\_RAS}}$, $\overline{\text{SD\_WE}}$, SD_BA, SD_CS[1:0] - Output Valid	$t_{SDCHACV}$	—	0.5 × SD_CLK + 1.0	ns	
SD5	Address, SD_CKE, $\overline{\text{SD\_CAS}}$, $\overline{\text{SD\_RAS}}$, $\overline{\text{SD\_WE}}$, SD_BA, SD_CS[1:0] - Output Hold	$t_{SDCHACI}$	2.0	—	ns	
SD6	SD_SDR_DQS Output Valid	t_{DQSOV}	—	Self timed	ns	4
SD7	SD_DQS[3:2] input setup relative to SD_CLK	$t_{DQVSDCH}$	0.25 × SD_CLK	0.40 × SD_CLK	ns	5

Table 14. SDR Timing Specifications (continued)

Num	Characteristic	Symbol	Min	Max	Unit	Notes
SD8	SD_DQS[3:2] input hold relative to SD_CLK	$t_{DQISDCH}$	Does not apply. 0.5×SD_CLK fixed width.			6
SD9	Data (D[31:0]) Input Setup relative to SD_CLK (reference only)	t_{DVSDCH}	0.25 × SD_CLK	—	ns	7
SD10	Data Input Hold relative to SD_CLK (reference only)	t_{DISDCH}	1.0	—	ns	
SD11	Data (D[31:0]) and Data Mask(SD_DQM[3:0]) Output Valid	$t_{SDCHDMV}$	—	0.5 × SD_CLK + 2	ns	
SD12	Data (D[31:0]) and Data Mask (SD_DQM[3:0]) Output Hold	$t_{SDCHDMI}$	1.5	—	ns	

1 The device supports same frequency of operation for both FlexBus and SDRAM clock operates as that of the internal bus clock. Please see the PLL chapter of the device reference manual for more information on setting the SDRAM clock rate.

2 SD_CLK is one SDRAM clock in ns.

3 Pulse width high plus pulse width low cannot exceed min and max clock period.

4 SD_SDR_DQS is designed to pulse 0.25 clock before the rising edge of the memory clock. This is a guideline only. Subtle variation from this guideline is expected. SD_SDR_DQS will only pulse during a read cycle and one pulse will occur for each data beat.

5 SD_DQS is designed to pulse 0.25 clock before the rising edge of the memory clock. This spec is a guideline only. Subtle variation from this guideline is expected. SD_DQS will only pulse during a read cycle and one pulse will occur for each data beat.

6 The SD_DQS pulse is designed to be 0.5 clock in width. The timing of the rising edge is most important. The falling edge does not affect the memory controller.

7 Since a read cycle in SDR mode still uses the DQS circuit within the device, it is critical that the data valid window be centered 1/4 clk after the rising edge of DQS. Ensuring that this happens will result in successful SDR reads. The input setup spec is provided as guidance.

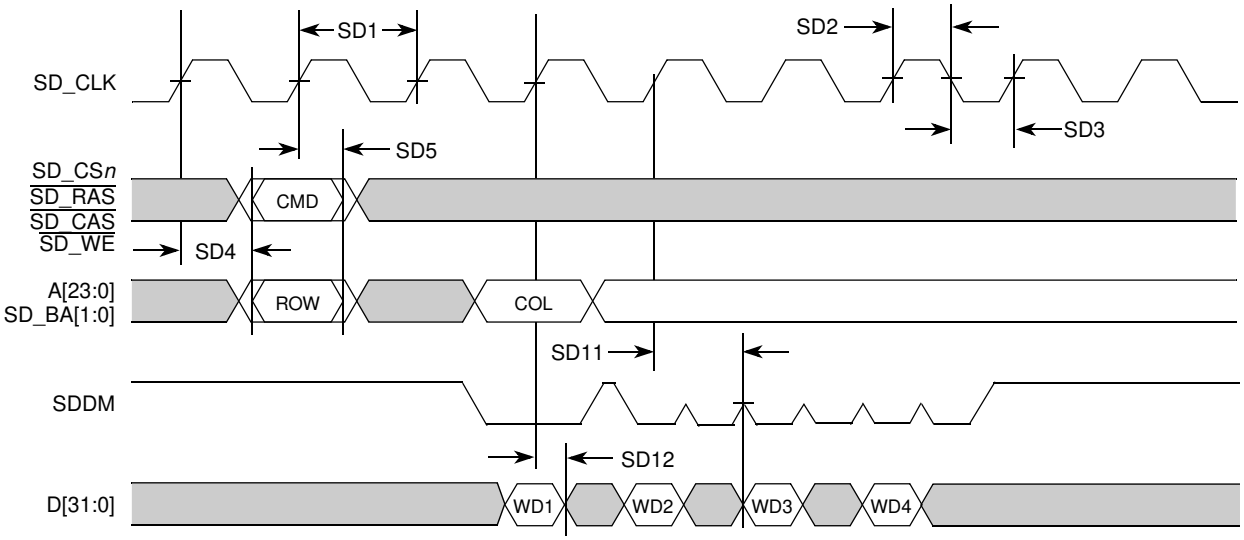

Figure 11. SDR Write Timing

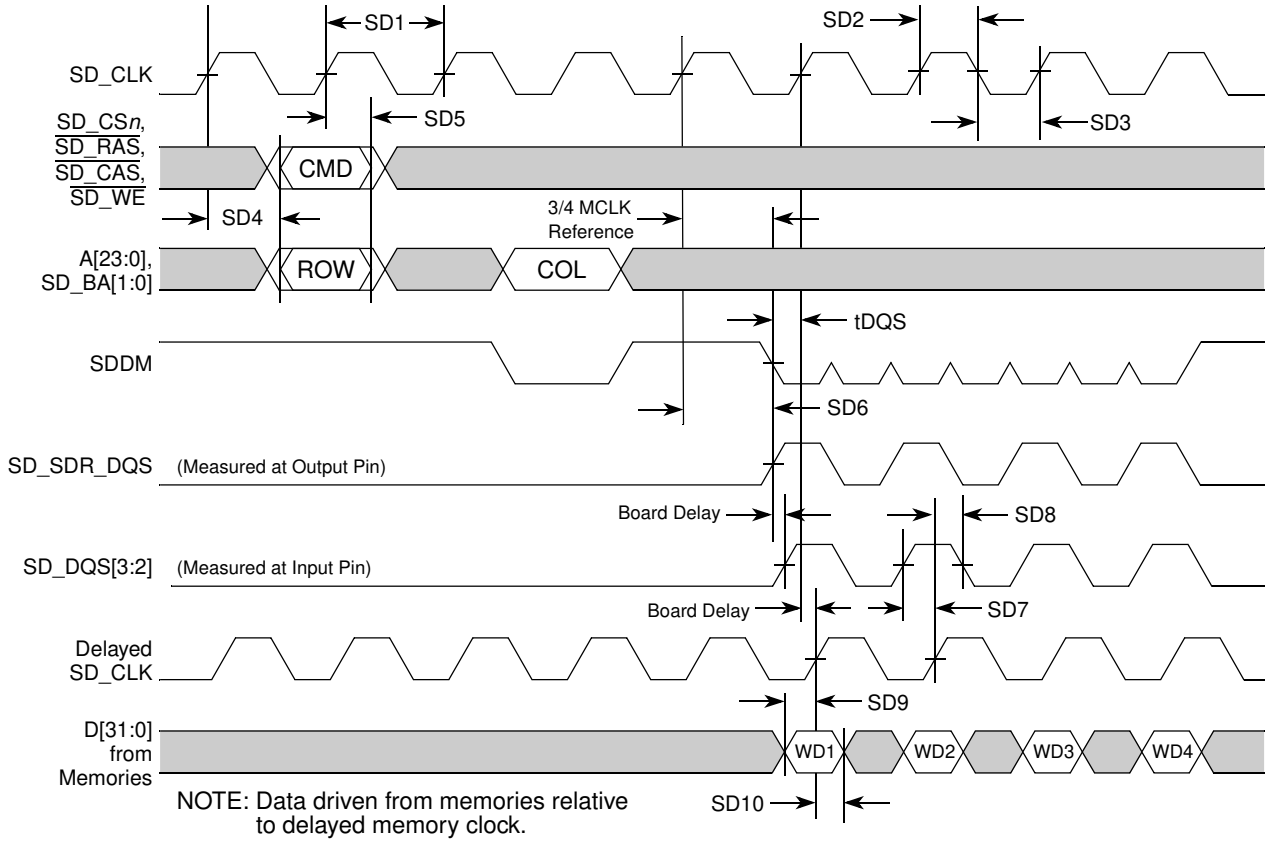

Figure 12. SDR Read Timing

5.7.2.2 DDR SDRAM AC Timing Specifications

When using the SDRAM controller in DDR mode, the following timing numbers must be followed to properly latch or drive data onto the memory bus. All timing numbers are relative to the two DQS byte lanes.

Table 15. DDR Timing Specifications

Num	Characteristic	Symbol	Min	Max	Unit	Notes
	Frequency of Operation	t_{DDCK}	60	83.33	MHz	1
DD1	Clock Period	t_{DDSK}	12.0	16.67	ns	2
DD2	Pulse Width High	t_{DDCKH}	0.45	0.55	SD_CLK	3
DD3	Pulse Width Low	t_{DDCKL}	0.45	0.55	SD_CLK	3
DD4	Address, SD_CKE, $\overline{\text{SD\_CAS}}$, $\overline{\text{SD\_RAS}}$, $\overline{\text{SD\_WE}}$, $\overline{\text{SD\_CS}}$[1:0] - Output Valid	$t_{SDCHACV}$	—	0.5 × SD_CLK + 1.0	ns	4
DD5	Address, SD_CKE, $\overline{\text{SD\_CAS}}$, $\overline{\text{SD\_RAS}}$, $\overline{\text{SD\_WE}}$, $\overline{\text{SD\_CS}}$[1:0] - Output Hold	$t_{SDCHACI}$	2.0	—	ns	
DD6	Write Command to first DQS Latching Transition	t_{CMDVDQ}	—	1.25	SD_CLK	
DD7	Data and Data Mask Output Setup (DQ→DQS) Relative to DQS (DDR Write Mode)	t_{DQDMV}	1.5	—	ns	5 6
