Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Low On-Resistance, 3.3V High-Bandwidth 4-Port, 2:1 Mux/DeMux VideoSwitch

## Features

- Near-Zero propagation delay
- $5 \Omega$ switches connect inputs to outputs
- High signal passing bandwidth ( 500 MHz )
- Beyond Rail-to-Rail switching
- 5 V I/O tolerant with 3.3 V supply
- 2.5 V and 3.3 V supply voltage operation
- Hot insertion capable
- Industrial operating temperature: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- 2KV ESD Protection (human body model)
- Latch-up performance $>250 \mathrm{~mA}$ per JESD17
- Packaging (Pb-free \& Green available):
- 16-pin QSOP (Q)
- 16-pin TSSOP (L)
- 20-contact TQFN (ZH)

## Description

Pericom Semiconductor's PI3V312 is a 4-port, 2:1 Multiplexer/ Demultiplexer with 3-state outputs. The switch introduces no additional ground bounce noise or propagation delay.
Low On-Resistance and High bandwidth make it ideal for video and other applications. Also this device has exceptionally low crosstalk and off-isolation, which is far greater than most analog switches offered today. A single 3.3 V supply is all that is required for operation.
The PI3V312 offers a high-performance ( 500 MHz ), low-cost solution to switch between video signals that have high bandwidth.

## Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)
Storage Temperature ............................................. $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Ambient Temperature with Power Applied ............... $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
Supply Voltage to Ground Potential ......................... -0.5 V to +4.6 V
DC Input Voltage ....................................................... -0.5 V to +6.0 V
DC Output Current..................................................................... 120 mA
Power Dissipation.......................................................................... 0.5 W

Note:
Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes:

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
2. Typical values are at $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ ambient and maximum loading.
3. Not more than one output should be shorted at one time. Duration of the test should not exceed one second.
4. Measured by the voltage drop between $Y$ and In pin at indicated current through the switch. On-Resistance is determined by the lower of the voltages on the two (Y, In) pins.
5. This parameter is determined by device characterization but is not production tested.

Notes:

1. See test circuit and waveforms.
2. This parameter is guaranteed but not tested on Propagation Delays.
3. The switch contributes no propagational delay other than the RC delay of the On-Resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.30 ns for 10 pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.

## Bandwidth vs Capacitance

## Test Circuit for Electrical Characteristics ${ }^{(1)}$

Notes:

1. $\mathrm{C}_{\mathrm{L}}=$ Load capacitance: includes jig and probe capacitance.
2. $\quad \mathrm{R}_{\mathrm{T}}=$ Termination resistance: should be equal to $\mathrm{Z}_{\text {OUT }}$ of the Pulse Generator
3. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control.

Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
4. All input impulses are supplied by generators having the following characteristics: $\mathrm{PRR} \leq \mathrm{MHz}, \mathrm{Z}_{\mathrm{O}}=50 \Omega, \mathrm{t}_{\mathrm{R}} \leq 2.5 \mathrm{~ns}, \mathrm{t}_{\mathrm{F}} \leq 2.5 \mathrm{~ns}$.
5. The outputs are measured one at a time with one transition per measurement.

## Applications Information

## Logic Inputs

The logic control inputs can be driven upto 3.6 V regardless of the supply voltage. For example, given a +3.3 V supply, $\overline{\mathrm{EN}}$ maybe driven LOW to 0 V and HIGH to 3.6 V . Driving $\overline{\mathrm{EN}}$ Rail-to-Rail ${ }^{\circledR}$ minimizes power consumption.

## Power Supply-Sequencing

Proper power supply sequencing is recommended for all CMOS devices. Always apply $\mathrm{V}_{\mathrm{CC}}$ before applying signals to the input/ output or control pins.

## Hot Insertion

For Datacom and Telecom applications that have ten or more volts passing through the backplane, a high voltage from the power supply may be seen at the device input pins during hot insertion. The PI3V312 device have maximum limits of 6 V and 120 mA for 20ns. If the power is higher or applied for a longer time or repeatedly reaches the maximum limits, the devices can be damaged.
