

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

1.2V to 3.6V Universal Bidirectional Level Shifter with Automatic Direction Control

Features

- PI4ULS3V08M is designed for low voltage operation: 1.2V to 3.6V
- Universal bidirectional level shifting with automatic direction control
- Fast bus speeds up to 90 Mbps for push-pull application
- Drive Capability 12mA
- Independent translation of each bit
- Each supply rail is configurable over supply range
- ESD Protection exceeds JESD22
 - 2000V Human Body Model (A114-B)
 - 200V Machine Model (A115-A)
- Latch-up performance exceeds 100mA per JESD 78
- Industrial operation at -40°C to +85°C
- Package: 32-contact TQFN 3x6

Description

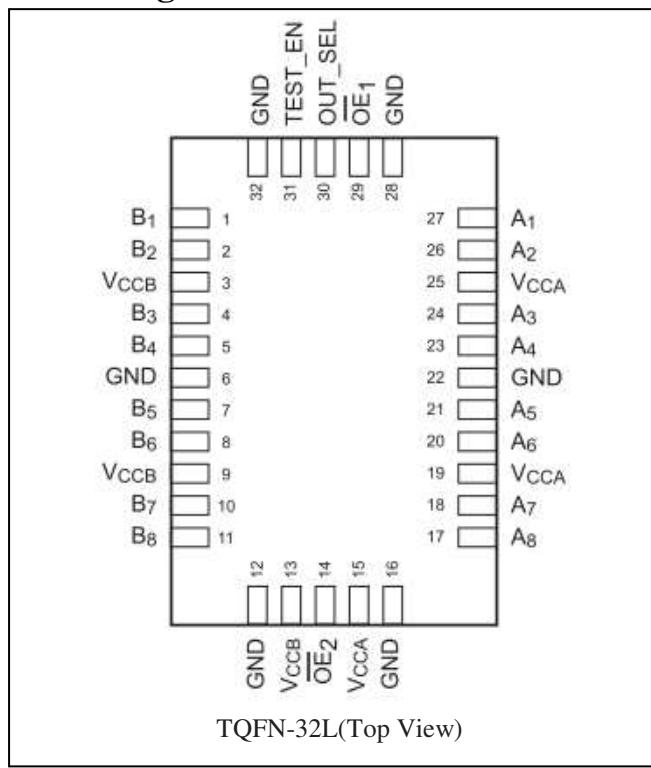

PI4ULS3V08M, is a 8-bit (octal) non-inverting bus transceiver with two separate supply rails: A port (VCCA) and B port (VCCB) are set to operate at 1.2V to 3.6V. This arrangement permits universal bidirectional translation of differential signal levels over the voltage ranges.

The PI4ULS3V08M is designed for asynchronous communication between data buses. Data is transmitted from the A bus to the B bus, or vice versa, without direction control. All AX, and BX are tri-stated when data is coming from both directions at the same time. The output-enable (\overline{OE}) input is used to disable outputs so buses are isolated.

The control pins \overline{OEx} , TEST_EN and OUT_SEL are supplied by VCCB.

To ensure the high impedance state during power-up or power-down, the output-enable (\overline{OEx}) input should be tied to VCC through a pull-up resistor: the minimum value of the resistor is determined by the current-sinking capability of the driver.

Applications

- Voltage Translation
- Bus Relay
- Mobile Devices

Pin Description

Pin Name	Description
\overline{OEx}	3-State Output Enable Inputs (Active Low)
Ax	Side A Inputs/Outputs
Bx	Side B Inputs/Outputs
TEST_EN	Enable Test Mode
OUT_SEL	Output impedance select
GND	Ground
VCCA, VCCB	Power

Note:

- 1 The input negative voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.
- 2 This value is limited to 3.6V maximum.
- 3 Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes:

1. C_L includes probe and jig capacitance.
2. All input pulses are supplied by generators having the following characteristics: $PRR \leq 10\text{MHz}$, $Z_O=50\Omega$, $t_r \leq 2.5\text{ns}$, $t_f \leq 2.5\text{ns}$.
3. The outputs are measured one at a time with one transition per measurement.
4. V_{CCI} defines the input port (V_{CCA} or V_{CCB}).
5. V_{CCO} defines the output port (V_{CCA} or V_{CCB}).
