Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Features

- Near-Zero propagation delay
- $5 \Omega$ switch connects inputs to outputs
- Direct bus connection when switches are ON
- Ultra-low quiescent power ( $0.2 \mu \mathrm{~A}$ typical)
- Ideally suited for notebook applications
- Industrial operating temperature: $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
- Packaging ( Pb -free \& Green available):
- 56-pin 173-mil wide plastic TVSOP
- 56-pin 240-mil wide thin plastic TSSOP
- 56-pin 300-mil wide plastic SSOP

## Description

Pericom Semiconductor'sPI5C16211 is a 24-bit bus switch designed with a low On-Resistance allowing inputs to be connected directly to outputs. This device operates as a 24 -bit or a 12 -bit bus switch, which provides high speed bus switching.

## Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

## Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## Notes:

1. Typical values are at $\mathrm{V}_{\mathrm{CC}}=5.0 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ ambient and maximum loading.
2. This parameter is determined by device characterization but is not production tested.
3. Measured by the voltage drop between A and B pin at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two $(A, B)$ pins.

Notes:

1. This parameter is guaranteed but not tested on Propagation Delays. The bus switch contributes no propagational delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25 ns for 50 pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
