Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Phase-Locked Loop Clock Driver

Features

- Clock doubler
- High-Performance Phase-Locked-Loop Clock Distribution for Networking, ATM, 100 MHz and 134 MHz Registered DIMM Synchronous DRAM modules for server, workstation, and PC applications
- Zero Input-to-Output delay
- Cycle-to-Cycle jitter ≤ ±150ps max.
- On-chip series damping resistor at clock output drivers for low noise and EMI reduction
- Operates at 3.3V V_{CC}
- Packaging (Pb-free & Green available):
  — 8-pin SOIC Package (W)

Description

The PI6C2402 features a low-skew, low-jitter, Phase-Locked Loop (PLL) clock driver. By connecting the feedback CLK_OUT output to the feedback FB_IN input, the propagation delay from the CLK_IN input to any clock output will be nearly zero. The PI6C2402 provides 2X CLK_IN on CLK_OUT output.

Applications

If the system designer needs more than 16 outputs with the features just described, using two or more zero-delay buffers such as the PI6C2509, and the PI6C2510, are likely to be impractical. The device-to-device skew introduced can significantly reduce the performance. Pericom recommends the use of a zero-delay buffer and an eighteen output non-zero-delay buffer. As shown in Figure 1, this combination produces a zero-delay buffer with all the signal characteristics of the original zero-delay buffer, but with as many outputs as the non-zero-delay buffer part. For example, when combined with an eighteen output non-zero delay buffer, a system designer can create a seventeen-output zero-delay buffer.

Pin Functions

Name	Number	Type	Description
CLK_IN	1	I	Reference Clock inptu, CLK_IN allows spread spectrum clock input
AV_{CC}	2	Power	Analog Power
AGND	3	Ground	Analog Ground
CLK_OUT	4	O	Clock Output. The output provides low-skew copies of CLK_IN and has an embedded series-damping resistor.
S	5	I	Control Input S. S is used to bypass the PLL for test purposes. When S is strapped to ground, PLL is bypassed and CLK_IN is buffered directly to the device outputs
GND	6	Ground	Ground
V_{CC}	7	Power	Power Supply
FB_IN	8	I	Feedback input. FB_IN provides the feedback signal to the internal PLL.

Absolute Maximum Ratings(1) (Over operating free-air temperature range)
