

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

### Features

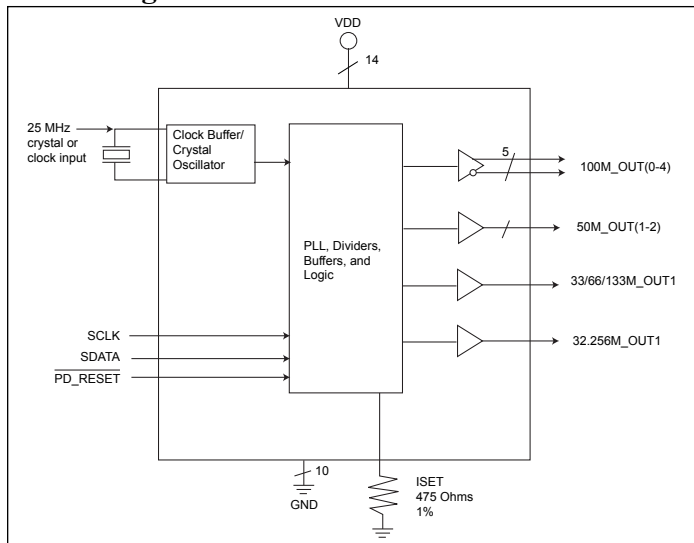

- 3.3V +/-10% Supply Voltage
- Uses 25MHz xtal such as Saronix-eCera™ SRX7278
- Five PCIe® 100MHz outputs with optional -0.5% spread spectrum support
- Two LVCMOS 50MHz outputs that support +/- 10% frequency margining
- One frequency selectable 33/66/133MHz LVCMOS output
- One 32.256MHz LVCMOS output
- Industrial temperature -40°C to 85°C
- Package: 48-pin TSSOP package

### Description

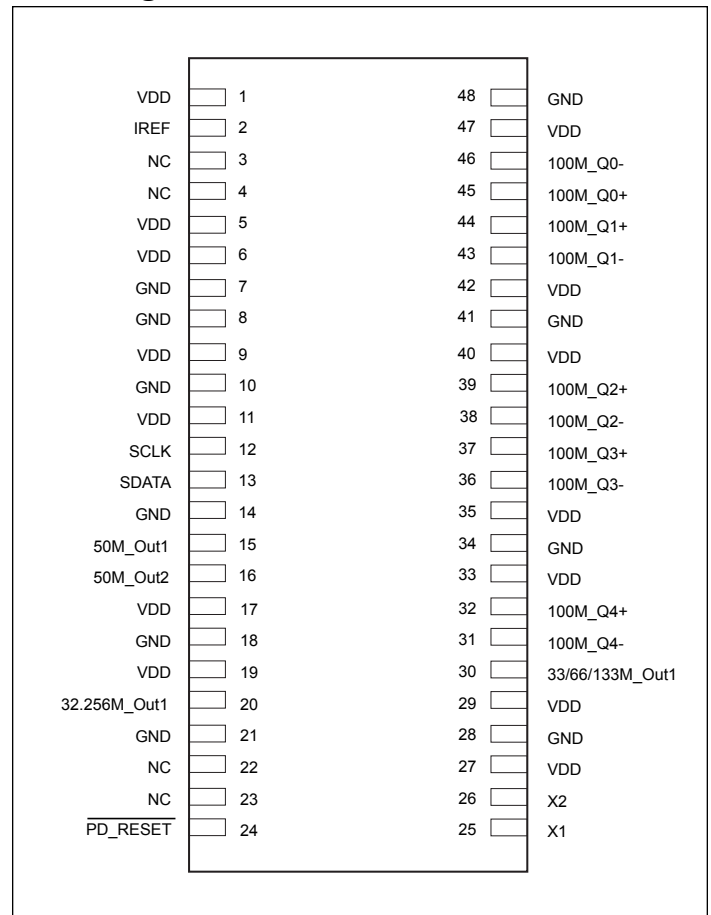

The PI6C49003 is a clock generator device intended for PCIe®/ networking applications. The device includes five 100MHz differential Host Clock Signal Level (HCSL) outputs for PCIe, two single-ended 50 MHz outputs, one single-ended 32.256MHz output, and one selectable single-ended 33/66/133 MHz output.

Using a serially programmable SMBUS interface, the PI6C49003 incorporates spread spectrum modulation on the five 100 MHz HCSL PCIe outputs, and independent frequency margining on the 50MHz output, 33.333MHz and 66.6666MHz clock outputs.

(Continued)

**Notes:**

1. Measured at the end of an 8-inch trace with a 5pF load.
2. Measurement taken from a single-ended waveform.
3. Measurement taken from a differential waveform.
4. Measured from -150 mV to +150 mV on the differential waveform. The signal is monotonic through the measurement region for rise and fall time. The 300 mV measurement window is centered on the differential zero crossing.
5. Measured at crossing point where the instantaneous voltage value of the rising edge of 100M+ equals the falling edge 100M-.
6. Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement.
7. Defines as the absolute minimum or maximum instantaneous period. This includes cycle-to-cycle jitter, relative PPM tolerance, and spread spectrum modulation.
8. Defined as the total variation of all crossing voltages of rising 100M+ and falling 100M-.
9. Refer to section 4.3.2.1 of the PCI Express Base Specification, Revision 1.1 for information regarding PPM considerations.
10. PPM refers to parts per million and is a DC absolute period accuracy specification. 1 PPM is 1/1,000,000th of 100 MHz exactly or 100 Hz. For 300 PPM there is an error budget of  $100\text{Hz}/\text{PPM} * 300 \text{ PPM} = 30 \text{ kHz}$ . The period is measured with a frequency counter with measurement window set at 100 ms or greater. With spread spectrum turned off the error is less than  $\pm 300 \text{ ppm}$ . With spread spectrum turned on there is an additional +2500 PPM nominal shift in maximum period resulting from the -0.5% down spread.
