

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

PI74ALVCH16501

18-Bit Universal Bus Transceiver With 3-State Outputs

Product Features

- PI74ALVCH16501 is designed for low voltage operation
- $V_{CC} = 2.3 \text{V to } 3.6 \text{V}$
- Hysteresis on all inputs
- Typical V_{OLP} (Output Ground Bounce) $< 0.8 \text{V at V}_{CC} = 3.3 \text{V}, T_{A} = 25^{\circ}\text{C}$
- Typical V_{OHV} (Output V_{OH} Undershoot) < 2.0 V at $V_{CC} = 3.3 \text{V}$, $T_A = 25^{\circ}\text{C}$
- Bus Hold retains last active bus state during 3-STATE eliminating the need for external pullup resistors
- Industrial operation at –40°C to +85°C
- Packages available:
 - -48-pin 240 mil wide plastic TSSOP (A)
 - -48-pin 300 mil wide plastic SSOP (V)

Product Description

Pericom Semiconductor's PI74ALVCH series of logic circuits are produced in the Company's advanced 0.5 micron CMOS technology, achieving industry leading speed.

The 18-bit PI74ALVCH16501 univeral bus transceiver is designed for 2.3V to 3.6V V_{CC} operation.

Data flow in each direction is controlled by Output Enable (OEAB and OEBA), Latched Enable (LEAB and LEBA), and CLOCK (CLKAB and CLKBA) inputs. For A-to-B data flow, the device operates in the transparent mode when LEAB is HIGH. When LEAB is LOW, the A data is latched if CLKAB is held at a high or low logic level. If LEAB is LOW, the A-bus is stored in the latch/flip-flop on the low-to-high transition of CLKAB. When OEAB is HIGH, the outputs are active. When OEAB is LOW, the outputs are in the highimpedance state.

Data flow for B to A is similar to that of A to B but uses OEBA, LEBA, and CLKBA. The Output Enables are complementary (OEAB is active HIGH and OEBA is active LOW).

To ensure the high-impedance state during power up or power down, OEBA should be tied to V_{CC} through a pull-up resistor and OEAB should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level.

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature	65°C to +150°C
Ambient Temperature with Power Applied	40°C to +85°C
Input Voltage Range, VIN	-0.5 V to $V_{CC} + 0.5$ V
Output Voltage Range, VOUT	-0.5 V to $V_{CC} + 0.5$ V
DC Input Voltage	0.5V to +5.0V
DC Output Current	100 mA
Power Dissipation	1.0W

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
