Product Description

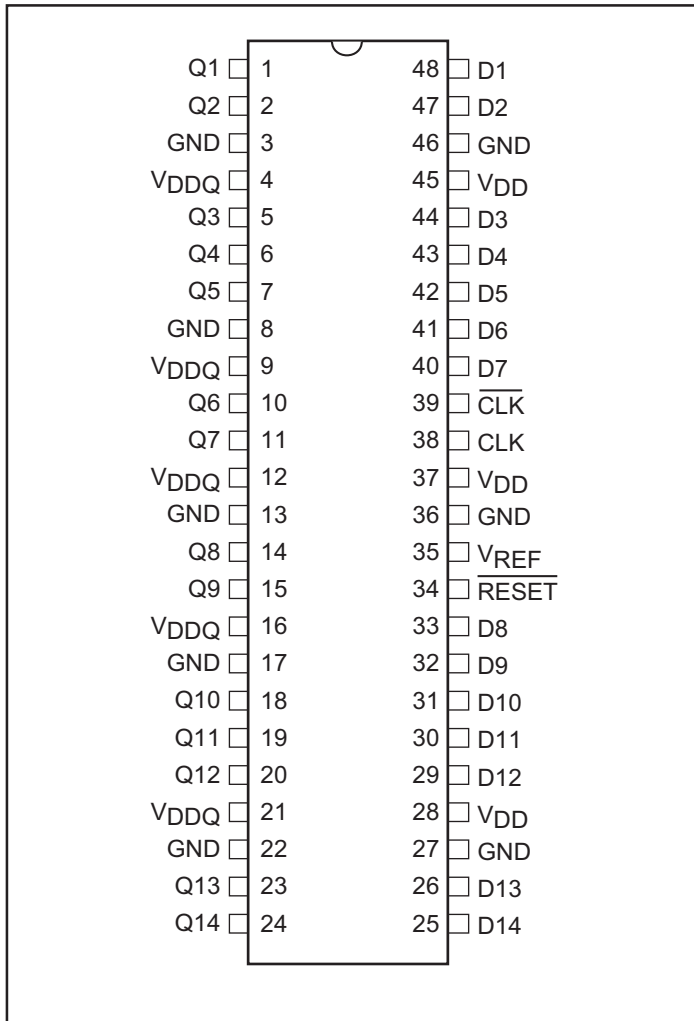

Pericom Semiconductor's PI74SSTV16857 series of logic circuits are produced using the Company's advanced 0.35 micron CMOS technology, achieving industry leading speed.

The 14-bit PI74SSTV16857 universal bus driver is designed for 2.3V to 2.7V V_{DD} operation and SSTL_2 I/O Levels except for the \overline{RESET} input which is LVCMOS.

Data flow from D to Q is controlled by the differential clock, CLK, \overline{CLK} and \overline{RESET} . Data is triggered on the positive edge of CLK. \overline{CLK} must be used to maintain noise margins.

\overline{RESET} must be supported with LVCMOS levels as V_{REF} may not be stable during power-up. \overline{RESET} is asynchronous and is intended for power-up only and when low assures that all of the registers reset to the Low State, Q outputs are low, and all input receivers, data and clock, are switched off.

Pericom's PI74SSTV16857 is characterized for operation from 0° to $70^{\circ}C$.
