

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

SERDES Gigabit Ethernet Transceiver**Features**

- IEEE 802.3z Gigabit Ethernet Compliant
- Supports 1.25 Gbps Using NRZ Coding over uncompensated twin coax cable
- Fully integrated CMOS IC
- Low Power Consumption
- ESD rating >2000V (Human Body Model) or > 200V (Machine Model)
- 5-Volt Input Tolerance
- Pin-Compatible with Agilent HDMP1636A/HDMP- 1646A and Vitesse VSC7123 transceivers (see Appendix A)
- Packaging (Pb-free & Green available):
 - 64-pin LQFP (FC)
 - 64-pin LQFP (FG)

Applications

- Gigabit Ethernet
- Serial Backplane
- Proprietary point-to-point applicaitons
- Passive Optical Networks

Description

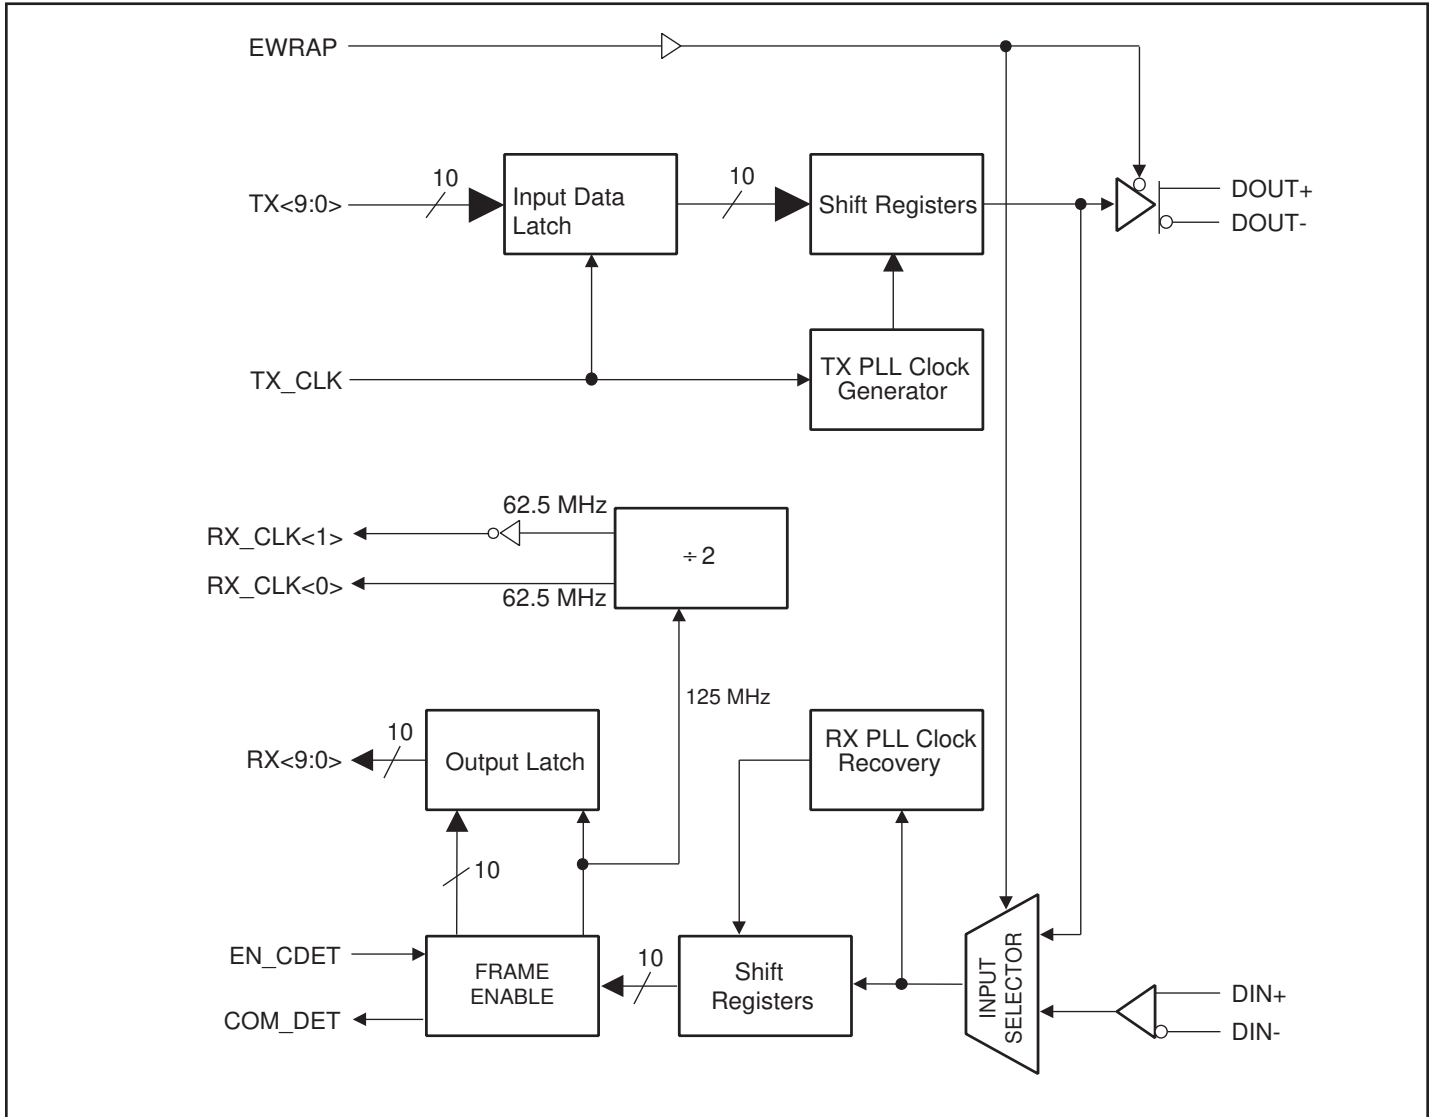

The PI90SD1636C is a single chip, Gigabit Ethernet transceiver. It performs all the functions of the Physical Medium Attachment (PMA) portion of the Physical layer, as specified by the IEEE 802.3z Gigabit Ethernet standard. These functions include parallel-to-serial and serial-to-parallel conversion, clock generation, clock data recovery, and word synchronization. In addition, an internal loopback function is provided for system debugging.

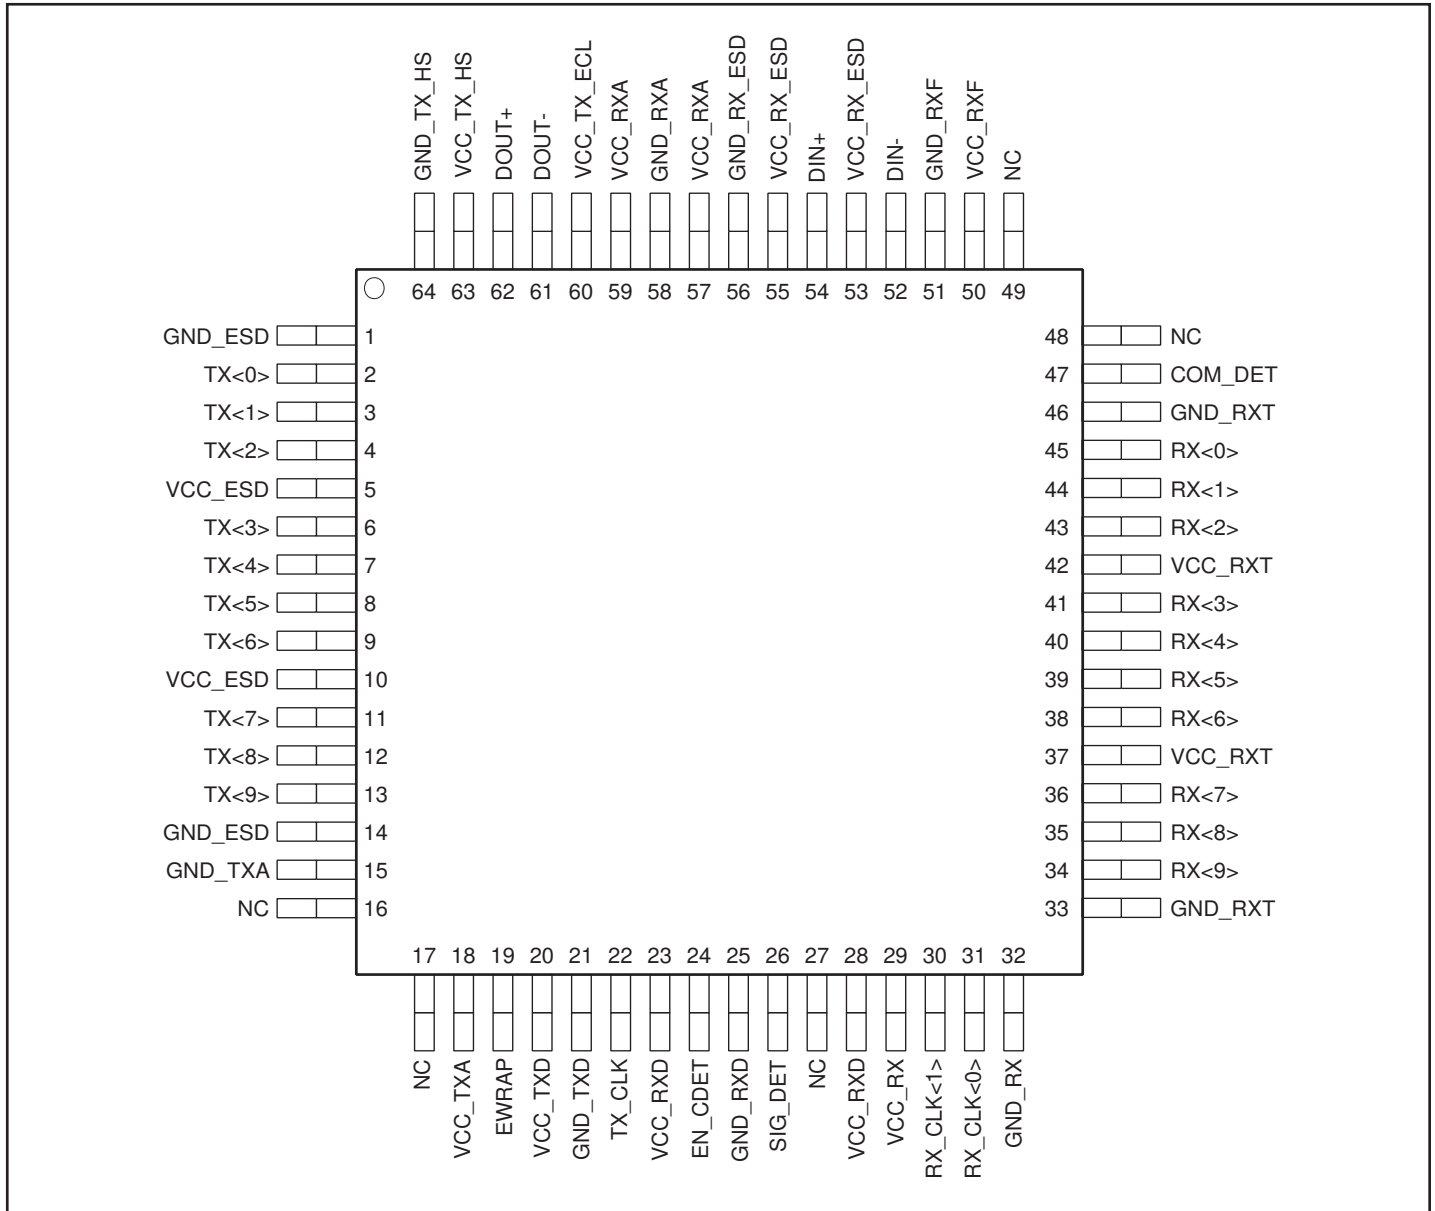

The PI90SD1636C is ideal for Gigabit Ethernet, serial backplane and proprietary point-to-point applications. The device supports 1000BASE-LX and 1000BASE-SX fiber-optic media, and 1000BASE-CX copper media.

The transmitter section of the PI90SD1636C accepts 10-bit wide parallel TTL data and converts it to a high speed serial data stream. The parallel data is encoded in 8b/10b format. This incoming parallel data is latched into an input register, and synchronized on the rising edge of the 125 MHz reference clock supplied by the user. A phase locked loop (PLL) locks to the 125 MHz clock. The clock is then multiplied by 10 to produce a 1.25 GHz serial clock that is used to provide the high speed serial data output. The output is sent through a Pseudo Emitter Coupled Logic (PECL) driver. This output connects directly to a copper cable in the case of 1000BASE-CX medium, or to a fiber optic module in the case of 1000BASE-LX or 1000BASE SX fiber optic medium.

The receiver section of the PI90SD1636C accepts a serial PECL-compatible data stream at a 1.25 Gbps rate, recovers the original 10-bit wide parallel data format, and retimes the data. A PLL locks onto the incoming serial data stream, and recovers the 1.25 GHz high speed serial clock and data. This is accomplished by continually frequency locking onto the 125 MHz reference clock, and by phase locking onto the incoming data stream. The serial data is converted back to parallel data format. The 'comma' character is used to establish byte alignment. Two 62.5 MHz clocks, 180 degrees out of phase, are recovered. These clocks are alternately used to clock out the parallel data on the rising edge. This parallel data is sent to the user in TTL-compatible form.

Functional Block Diagram

Pin Configuration

Table 1. I/O Type Definitions

Type	Definition
TTL_IN	TTL Input
TTL_OUT	TTL Output
HS_IN	High-Speed Input
HS_OUT	High-Speed Output
P	Power Ground

Table 2. Pin Description

Name	Pin #	Type	Description
GND_ESD VCC_ESD	1, 14 5, 10	P	Power and ground pairs for pad ESD structure.
TX<0> TX<1> TX<2> TX<3> TX<4> TX<5> TX<6> TX<7> TX<8> TX<9>	2 3 4 6 7 8 9 11 12 13	TTL_IN	0-bit parallel data input pins. This data should be 10b/8b encoded. The least significant bit is TX<0> and is transmitted first.
GND_TXA VCC_TXA	15 18	P	Power and ground pair for TX PLL analog circuits.
NC	16, 17, 27, 48, 49	NC	No Connect
EWRAP	19	TTL_IN	Wrap Enable. This pin is active HIGH. When asserted, the high-speed serial data are internally wrapped from the transmitter serial data output back to the receiver data input. Also, when asserted, DOUT± are held static at logic 1. When deasserted, DOUT± and .DIN± are active.
VCC_TXD GND_TXD	20 21	P	Power and ground pair for TX digital circuits.
TX_CLK	22	TTL_IN	Reference clock and transmit byte clock. This is a 125 MHz system clock supplied by the host system. On the positive edge of the clock, the input data, TX<9:0>, are latched into the register. This clock is multiplied by 10 internally, to generate the transmit serial bit clock.
VCC_RXD GND_RXD	23 28, 25	P	Power and ground pair for digital circuits in the receiver portion.
EN_CDET	24	TTL_IN	Comma Detect Enable. This pin is active HIGH. When asserted, the internal byte alignment function is turned on, to allow the clock to synchronize with the comma character (0011111XXX). When de-asserted, the function is disabled and will not align the clock and data. In this mode COM_DET is set to LOW.
SIG_DET	26	TTL_OUT	Signal Detect. This pin is active HIGH. It indicates the loss of input signal on the high-speed serial inputs, DIN±. SIG_DET is set to LOW when differential inputs are less than 50 mV.
VCC_RX GND_RX	29 32	P	Power and ground pair for the clock signal of the receiver portion.
RX_CLK<1> RX_CLK<0>	30 31	TTL_OUT	Receiver Byte Clocks. Two 180 degrees out-of-phase 62.5 MHz clock signals that are recovered by the receiver section. The received bytes are alternately clocked by the rising edges of these signals. The rising edge of RX_CLK<1> aligns with a comma character when detected.

Table 2. Pin Description (Continued.)

Name	Pin#	Type	Description
GND_RXT VCC_RXT	33 46, 37, 42	P	Power and ground pairs for ESD structure.
RX<9> RX<8> RX<7> RX<6> RX<5> RX<4> RX<3> RX<2> RX<1> RX<0>	34 35 36 37 38 39 40 41 43 44 45	TTL_OUT	Received Parallel Data Output. RX<0> is the least significant bit and is received first. When DIN± lose input data, all RX pins will be held HIGH.
COM_DET	47	TTL_OUT	Comma detect. This pin is active HIGH. When asserted, it indicates the detection of comma character (0011111XXX). It is active only when EN_CEDT is enabled.
VCC_RXF GND_RXF	50 51	P	Power and ground pair for the front-end of the receiver section.
DIN-	52	HS_IN	High-speed serial data input. Serial data input is received when
DIN+	54		EWRAP is disabled.
VCC_RXESD GND_RXESD	53,55 56	P	Power and ground pair for ESD structure.
VCC_RXA GND_RXA	57, 59 58	P	Power and ground pair for analog circuits of the receiver section.
VCC_TX_ECL	60	P	Power supply to line driver circuits. Ground supply is from pin 64.
DOUT- DOUT+	61 62	HS_OUT	High-speed serial data output. These pins are active when EWRAP is disabled and are held static at logic 1 when EWRAP is enable.
VCC_TX_HS GND_TX_HS	63 64	P	Power and ground pair for high-speed transmit logic in the parallel-to-serial section.

Functional Block Description

Input Data Latch

The input data latch block latches the 10-bit TTL input parallel byte, TX<9:0>, on the rising edge of the 125 MHz user-provided TX_CLK into the holding registers.

Parallel-to-Serial Converter

The received 10-bit TTL parallel input byte is converted to serial PECL level data stream by the parallel-to-serial block, and is transmitted differentially to the line driver block at 1.25 Gbps. The 8b/10b encoded data is transmitted sequentially with bit 0 being sent first.

Clock Generator

The 125 MHz signal used for clocking the serial outputs is generated by the TX PLL block based on the user-provided TX_CLK. This clock should have a ± 100 ppm tolerance.

Internal Loopback

When EWRAP is set to a logic HIGH, the serial data stream generated by the transmitter is looped back to the receiver path, instead of going out to the DOUT \pm pins. When in loopback mode, a static logic 1 is transmitted at the line driver (DOUT+ is HIGH and DOUT- is LOW).

Signal Detect

Signal detect block is used to sense the serial input data stream at pins DIN \pm . If the serial input is lower than 50mV differentially, this block deasserts SIG_DET and sets the output, RX<9:0>, to all logic ones. When the serial input at pins DIN \pm is greater than 50mV, the signal is directed to the receive path.

Equalizer and Slicer

The signal received from the line (DIN \pm pins) is distorted by the cable bandwidth. In order to maintain a low bit-error rate, an equalizer is used to compensate for the signal loss. The slicer recovers the differential low-level signal to a CMOS-level single-ended signal, for clock recovery and data re-timing.

Clock Recovery

The serial input data stream contains both data and clock. The clock recovery block is used to extract both data and clocks from this input. In addition to data, two clocks of 62.5 MHz are recovered.

Table 3. Absolute Maximum Ratings

Symbol	Parameter	Min.	Max.	Units
V _{CC}	Supply voltage	-0.5	5.0	V
V _{IN,TTL}	TTL Input Voltage	-0.7	V _{CC} + 2.8	
V _{IN,HS_IN}	High-Speed Input Voltage	2.0	V _{CC}	
I _{OUT,TTL}	TTL Output Source Current		13	mA
T _{stg}	Storage Temperature	-65	+150	°C
T _j	Junction Operating Temperature	0	+150	

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only and correct functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Table 4. Guaranteed Operating Rates T_A = 0°C to +70°C, V_{CC} = 3.15V to 3.45V

Parallel Clock Rate (MHz)		SerialBaud Rate (Mbaud)	
Min.	Max.	Min.	Max.
124.0	126.0	1240	1260

Table 5. AC Electrical Characteristics T_A = 0°C to +70°C, V_{CC} = 3.15V to 3.45V

Symbol	Parameter	Min.	Typ.	Max.	Unit
t _{r,REFCLK}	REFCLK Rise Time, 0.8 to 2.0 Volts			2.4	ns
t _{f,REFCLK}	REFCLK Fall Time, 2.0 to 0.8 Volts			2.4	
t _{r,TTL_IN}	Input TTL Rise Time, 0.8 to 2.0 Volts		2		
t _{f,TTL_IN}	Input TTL Fall Time, 2.0 to 0.8 Volts		2		
t _{r,TTL_OUT}	Output TTL Rise Time, 0.8 to 2.0 Volts, 10 pF Load		1.5	2.4	
t _{f,TTL_OUT}	Output TTL Fall Time, 2.0 to 0.8 Volts, 10 pF Load		1.1	2.4	
t _{rs,HS_OUT}	HS_OUT Single-Ended (DOUT+) Rise Time	85	225	327	ps
t _{fs,HS_OUT}	HS_OUT Single-Ended (DOUT+) Fall Time	85	200	327	
V _{IP,HS_IN}	HS_IN Input Peak-to-Peak Differential Voltage	200	1200	2000	mV
V _{OP,HS_OUT(1)}	HS_OUT Output Peak-to-Peak Differential Voltage	1200	1600	2000	

Note:

1. Output Peak-to-Peak Differential Voltage specified as DOUT+ minus DOUT-

Table 6. DC Electrical Characteristics $T_A = 0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$, $V_{CC} = 3.15\text{V}$ to 3.45V

Symbol	Parameter	Min.	Typ.	Max.	Unit
$V_{IH,TTL}$	TTL Input High Voltage Level, Guaranteed High Signal for All Inputs	2		5.5	V
$V_{IL,TTL}$	TTL Input Low Voltage Level, Guaranteed Low Signal for All Inputs	0		0.8	
$V_{OH,TTL}$	TTL Output High Voltage Level, $I_{OH} = -12\text{ mA}$	2.2		V_{CC}	
$V_{OL,TTL}$	TTL Output Low Voltage Level, $I_{OL} = 12\text{ mA}$	0		0.6	
$I_{IH,TTL}$	Input High Current, $V_{IN} = V_{CC}$, $V_{CC} = 3.45\text{ V}$			5	μA
$I_{IL,TTL}$	Input Low Current, $V_{IN} = 0\text{V}$, $V_{CC} = 3.45\text{ V}$			-5	
$I_{CC,TRX}^{[1,2]}$	Transceiver V_{CC} Supply Current, $T_A = 25^{\circ}\text{C}$		220		mA

Notes:

1. Measurement Conditions: Tested sending 1250 MBd PRBS 2⁷-1 sequence from a serial Bit Error Rate Tester (BERT) with DOUT \pm outputs terminated with 150 Ω resistors to GND.
2. Typical values are at $V_{CC} = 3.3\text{ volts}$.

Table 7. Transceiver Reference Clock Requirements $T_A = 0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$, $V_{CC} = 3.15\text{V}$ to 3.45V

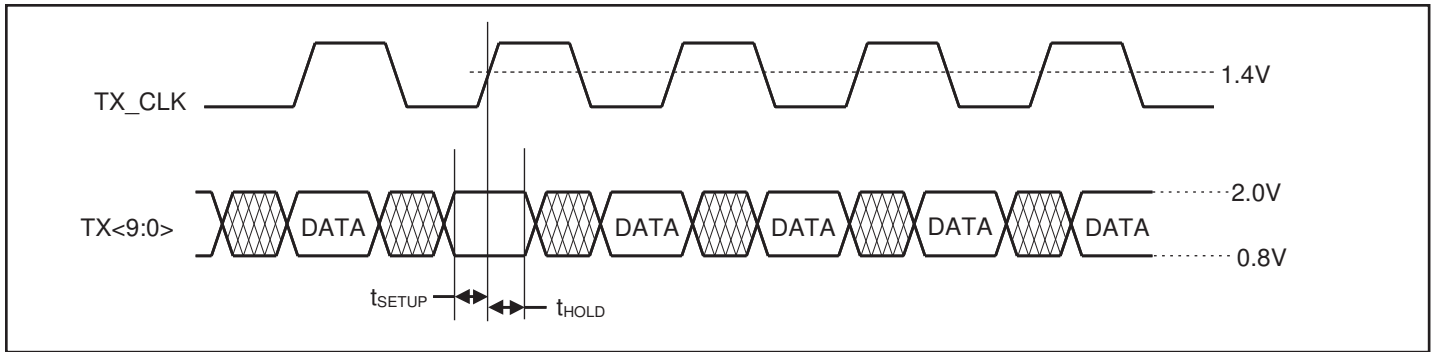

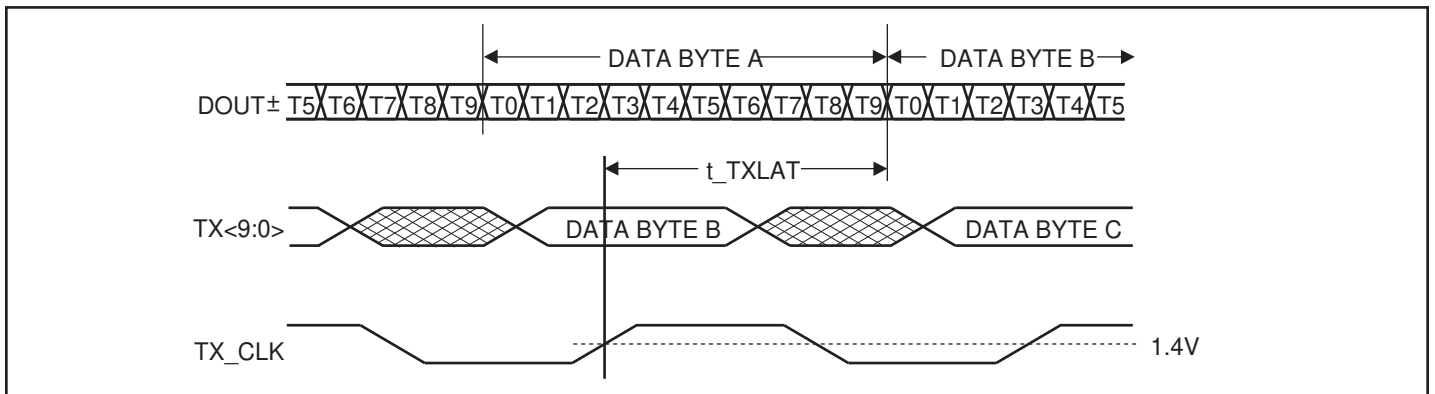

Symbol	Parameter	Min.	Typ.	Max.	Unit
f	Nominal Frequency (for gigabit Ethernet Compliance)		125		MHz
F_{tol}	Frequency Tolerance	-100		+100	ppm
Symm	Symmetry (Duty Cycle)	40		60	%

Table 8. Transmitter Timing Characteristics $T_A = 0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$, $V_{CC} = 3.15\text{V}$ to 3.45V

Symbol	Parameter	Min.	Typ.	Max.	Unit
t_{setup}	Setup Time to Rising Edge of TX_CLK	1.5			ns
t_{hold}	Hold Time to Rising Edge of TX_CLK	1.0			
$t_{txlat}^{[1]}$	Transmitter Latency		3.5		bits
			4.4		

Note:

1. The transmitter latency, as shown in Figure 4, is defined as the time between the latching in of the parallel data word (as triggered by the rising edge of the transmit by clock, REFCLK) and the transmission of the first serial bit of that parallel word (defined by the rising edge of the first bit transmitted).

Figure 3. Transmitter Section Timing

Figure 4. Transmitter Latency
Table 9. Receiver Timing Characteristics $T_A = 0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$, $V_{CC} = 3.15\text{V}$ to 3.45V

Symbol	Parameter	Min.	Typ.	Max.	Unit
b_sync ^[1]	Bit Sync Time			2500	bits
f_lock	Frequency Lock at Powerup			500	μs
t _{SETUP}	Data Setup Before Rising Edge of RX_CLK	2.5			ns
t _{HOLD}	Data Hold After Rising Edge of RX_CLK	1.5			
t _{DUTY}	RX_CLK Duty Cycle	40		60	%
t _{A-B}	RX_CLK Skew	7.5		8.5	ns
T _{rxlat} ^[2]	Receiver Latency		22.4		ns
			28.0		bits

Notes:

1. This is the recovery for input phase jumps.
2. The receiver latency as shown in Figure 6, is defined as the time between receiving the first serial bit of a parallel data word (defined as the first edge of the first serial bit) and the clocking out of that parallel word (defined by the rising edge of the receive byte clock, either RBC1 or RBC0).

Pin Cross Reference Guide

PI90SD1636C, VSC7123 and HDMP1636A/1646A

Summary:

Pericom Semiconductor's PI90SD1636C is functionally pin compatible with Vitesse's VSC7123 and Agilent's HDMP-1636A/46A. Minor differences exist amongst the parts regarding the use of certain pins that are used by the manufacturer for internal tests, as is further clarified below. These differences will not affect plug compatibility during normal operations.

Pin #	Pericom PI90SD1636C	Vitesse VSC7123	Agilent HDMP1636A/46A	Comments
1	GND_ESD	VSSD	GND	Connect to the ground plane.
2	TX<0>	T0	TX[0]	10-bit parallel data input pins.
3	TX<1>	T1	TX[1]	
4	TX<2>	T2	TX[2]	
6	TX<3>	T3	TX[3]	
7	TX<4>	T4	TX[4]	
8	TX<5>	T5	TX[5]
