

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

PIC18(L)F25/26K83

28-Pin, Low-Power, High-Performance Microcontrollers with CAN Technology

Description

The PIC18(L)FXXK83 is a full-featured CAN product family that can be used in automotive and industrial applications. The multitude of communication peripherals found on the product family, such as CAN, SPI, two I²Cs, two UARTs, LIN, DMX, and DALI can handle a wide range of wired and wireless (using external modules) communication protocols for intelligent applications. This family includes a 12-bit ADC with Computation (ADC²) extensions for automated signal analysis to reduce the complexity of the application. This, combined with the Core Independent Peripherals integration capabilities, enables functions for motor control, power supply, sensor, signal and user interface applications.

Core Features

- C Compiler Optimized RISC Architecture
- Operating Speed:
 - Up to 64 MHz clock operation
 - 62.5 ns minimum instruction cycle
- Two Direct Memory Access (DMA) Controllers:
 - Data transfers to SFR/GPR spaces from either Program Flash Memory, Data EEPROM or SFR/GPR spaces
 - User-programmable source and destination sizes
 - Hardware and software-triggered data transfers
- System Bus Arbiter with User-Configurable Priorities for Scanner and DMA1/DMA2 with respect to the main line and interrupt execution
- Vectored Interrupt Capability:
 - Selectable high/low priority
 - Fixed interrupt latency
 - Programmable vector table base address
- 31-Level Deep Hardware Stack
- Low-Current Power-on Reset (POR)
- Configurable Power-up Timer (PWRT)
- Brown-Out Reset (BOR)
- Low-Power BOR (LPBOR) Option
- Windowed Watchdog Timer (WWDT):
 - Variable prescaler selection
 - Variable window size selection
 - Configurable in hardware or software

Memory

- Up to 64 KB Flash Program Memory
- Up to 4 KB Data SRAM Memory
- Up to 1 KB Data EEPROM
- Memory Access Partition (MAP):
 - Configurable boot and app region sizes with individual write-protections
- Programmable Code Protection
- Device Information Area (DIA) stores:
 - Unique IDs and Device IDs
 - Temp Sensor factory-calibrated data
 - Fixed Voltage Reference calibrated data
- Device Configuration Information (DCI) stores:
 - Erase row size
 - Number of write latches per row
 - Number of user rows
 - Data EEPROM memory size
 - Pin count

Operating Characteristics

- Operating Voltage Range:
 - 1.8V to 3.6V (PIC18LF25/26K83)
 - 2.3V to 5.5V (PIC18F25/26K83)
- Temperature Range:
 - Industrial: -40°C to 85°C
 - Extended: -40°C to 125°C

Power-Saving Functionality

- DOZE mode: Ability to run CPU core slower than the system clock
- IDLE mode: Ability to halt CPU core while internal peripherals continue operating
- SLEEP mode: Lowest power consumption
- Peripheral Module Disable (PMD):
 - Ability to disable unused peripherals to minimize power consumption

eXtreme Low-Power (XLP) Features

- Sleep mode: 60 nA @ 1.8V, typical
- Windowed Watchdog Timer: 720 nA @ 1.8V, typical
- Secondary Oscillator: 580 nA @ 32 kHz
- Operating Current:
 - 4 μ A @ 32 kHz, 1.8V, typical
 - 45 μ A/MHz @ 1.8V, typical

Digital Peripherals

- Three 8-Bit Timers (TMR2/4/6) with Hardware Limit Timer (HLT):
 - Hardware monitoring and Fault detection
- Four 16-Bit Timers (TMR0/1/3/5)
- Four Configurable Logic Cell (CLC):
 - Integrated combinational and sequential logic
- Three Complementary Waveform Generators (CWGs):
 - Rising and falling edge dead-band control
 - Full-bridge, half-bridge, 1-channel drive
 - Multiple signal sources
 - Programmable dead band
 - Fault-shutdown input
- Four Capture/Compare/PWM (CCP) modules
- Four 10-bit Pulse-Width Modulators (PWMs)
- Numerically Controlled Oscillator (NCO):
 - Generates true linear frequency control
 - High resolution using 20-bit accumulator and 20-bit increment values
- DSM: Data Signal Modulator:
 - Multiplex two carrier clocks, with glitch prevention feature
 - Multiple sources for each carrier
- Programmable CRC with Memory Scan:
 - Reliable data/program memory monitoring for fail-safe operation (e.g., Class B)
 - Calculate CRC over any portion of program memory
- Two UART Modules:
 - Modules are Asynchronous, RS-232, RS-485 compatibility.
 - One of the UART modules supports LIN Master and Slave, DMX mode, DALI Gear and Device protocols
 - Automatic and user-timed BREAK period generation
 - DMA Compatible
 - Automatic checksums
 - Programmable 1, 1.5, and two Stop bits
 - Wake-up on BREAK reception

- One SPI module:
 - Configurable length bytes
 - Configurable length data packets
 - Receive-without-transmit option
 - Transmit-without-receive option
 - Transfer byte counter
 - Separate Transmit and Receive Buffers with 2-byte FIFO and DMA capabilities
- CAN module:
 - Conforms to CAN 2.0B Active Specification
 - Three operating modes: Legacy (compatible with existing PIC18CXX8/FXX8 CAN modules), Enhanced mode, and FIFO mode.
 - Message bit rates up to 1 Mbps
 - DeviceNet™ data byte filter support
 - Six programmable receive/transmit buffers
 - Three dedicated transmit buffers
 - Two dedicated receive buffers
 - 16 Full, 29-bit acceptance filters with dynamic association
 - Three full, 29-bit acceptance masks
 - Automatic remote frame handling
 - Advanced error management features.
- Two I²C modules, SMBus, PMBus™ compatible:
 - Dedicated Address, Transmit and Receive buffers
 - Bus Collision Detection with arbitration
 - Bus time-out detection and handling
 - Multi-Master mode
 - Separate Transmit and Receive Buffers with 2-byte FIFO and DMA capabilities
 - I²C, SMBus 2.0 and SMBus 3.0, and 1.8V input level selections
- Device I/O Port Features:
 - 25 I/O pins (PIC18(L)F25K83)
 - One input-only pin
 - Individually programmable I/O direction, open-drain, slew rate, weak pull-up control
 - Interrupt-on-change
 - Three External Interrupt Pins
- Peripheral Pin Select (PPS):
 - Enables pin mapping of digital I/O
- Two Signal Measurement Timer (SMT):
 - 24-bit timer/counter with prescaler

Analog Peripherals

- Analog-to-Digital Converter with Computation (ADC²):
 - 12-bit with up to 24 external channels
 - Automated post-processing
 - Automated math functions on input signals: averaging, filter calculations, oversampling and threshold comparison
 - Operates in Sleep
 - Integrated charge pump for improved low-voltage operation
- Hardware Capacitive Voltage Divider (CVD):
 - Automates touch sampling and reduces software size and CPU usage when touch or proximity sensing is required
 - Adjustable sample and hold capacitor array
 - Two guard ring output drives
- Temperature Sensor:
 - Internal connection to ADC
 - Can be calibrated for improved accuracy
- Two Comparators:
 - Low-Power/High-Speed mode
 - Fixed Voltage Reference at noninverting input(s)
 - Comparator outputs externally accessible
- 5-Bit Digital-to-Analog Converter (DAC):
 - 5-bit resolution, rail-to-rail
 - Positive Reference Selection
 - Unbuffered I/O pin output
 - Internal connections to ADCs and comparators
- Voltage Reference:
 - Fixed Voltage Reference with 1.024V, 2.048V and 4.096V output levels

Flexible Oscillator Structure

- High-Precision Internal Oscillator:
 - Selectable frequency range up to 64 MHz
 - $\pm 1\%$ at calibration (nominal)
- Low-Power Internal 32 kHz Oscillator (LFINTOSC)
- External 32 kHz Crystal Oscillator (SOCS)
- External Oscillator Block with:
 - x4 PLL with external sources
 - Three crystal/resonator modes up to 20 MHz
 - Three external clock modes up to 20 MHz
- Fail-Safe Clock Monitor
- Oscillator Start-up Timer (OST):
 - Ensures stability of crystal oscillator sources

- Note**
- 1: This is a PPS remappable input signal. The input function may be moved from the default location shown to one of several other PORTx pins.
 - 2: All output signals shown in this row are PPS remappable.
 - 3: This is a bidirectional signal. For normal module operation, the firmware should map this signal to the same pin in both the PPS input and PPS output registers.
 - 4: These pins can be configured for I²C and SMBTM 3.0/2.0 logic levels; the SCLx/SDAx signals may be assigned to any of the RB1/RB2/RC3/RC4 pins. PPS assignments to the other pins (e.g., RA5) will operate, but input logic levels will be standard TTL/ST as selected by the INLVL register, instead of the I²C specific or SMBUS input buffer thresholds.

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Website at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Website; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our website at www.microchip.com to receive the most current information on all of our products.

1.0 DEVICE OVERVIEW

This document contains device specific information for the following devices:

- PIC18F25K83
- PIC18LF25K83
- PIC18F26K83
- PIC18LF26K83

This family offers the advantages of all PIC18 microcontrollers – namely, high computational performance at an economical price – with the addition of high-endurance Program Flash Memory, Universal Asynchronous Receiver Transmitter (UART), Serial Peripheral Interface (SPI), Inter-integrated Circuit (I²C), Direct Memory Access (DMA), Configurable Logic Cells (CLC), Signal Measurement Timer (SMT), Numerically Controlled Oscillator (NCO), and Analog-to-Digital Converter with Computation (ADC²).

1.1 New Features

- **Direct Memory Access Controller:** The Direct Memory Access (DMA) Controller is designed to service data transfers between different memory regions directly without intervention from the CPU. By eliminating the need for CPU-intensive management of handling interrupts intended for data transfers, the CPU now can spend more time on other tasks.
- **Vectored Interrupt Controller:** The Vectored Interrupt Controller module reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the CPU. It assembles all of the interrupt request signals and resolves the interrupts based on both a fixed natural order priority and a user-assigned priority, thereby eliminating scanning of interrupt sources.
- **Universal Asynchronous Receiver Transmitter:** The Universal Asynchronous Receiver Transmitter (UART) module is a serial I/O communications peripheral. It contains all the clock generators, shift registers and data buffers necessary to perform an input or output serial data transfer, independent of device program execution. The UART, also known as a Serial Communications Interface (SCI), can be configured as a full-duplex asynchronous system or one of several automated protocols. Full-Duplex mode is useful for communications with peripheral systems, with DMA/DALI/LIN support.
- **Serial Peripheral Interface:** The Serial Peripheral Interface (SPI) module is a synchronous serial data communication bus that operates in Full-Duplex mode. Devices communicate in a master/slave environment where the master device initiates the communication. A slave device is controlled through a Chip Select known as Slave Select. Example slave devices include serial EEPROMs, shift registers, display drivers, A/D converters, or another PIC.
- **I²C Module:** The I²C module provides a synchronous interface between the microcontroller and other I²C-compatible devices using the two-wire I²C serial bus. Devices communicate in a master/slave environment. The I²C bus specifies two signal connections – Serial Clock (SCL) and Serial Data (SDA). Both the SCL and SDA connections are bidirectional open-drain lines, each requiring pull-up resistors to the supply voltage.
- **12-bit A/D Converter with Computation:** This module incorporates programmable acquisition time, allowing for a channel to be selected and a conversion to be initiated without waiting for a sampling period and thus, reduce code overhead. It has a new module called ADC² with computation features, which provides a digital filter and threshold interrupt functions.

1.2 Details on Individual Family Members

Devices in the PIC18(L)F25/26K83 family are available in 28-pin packages. The block diagram for this device is shown in [Figure 3-1](#).

The similarities and differences among the devices are listed in the PIC18(L)F25/26K83 Family Types Table (page 4). The pinouts for all devices are listed in [Table 3](#).

PIC18(L)F25/26K83

TABLE 1-1: DEVICE FEATURES

Features	PIC18(L)F25K83	PIC18(L)F26K83
Program Memory (Bytes)	32768	65536
Program Memory (Instructions)	16384	32768
Data Memory (Bytes)	2048	4096
Data EEPROM Memory (Bytes)	1024	1024
Packages	28-pin SPDIP 28-pin SOIC 28-pin SSOP 28-pin QFN 28-pin UQFN	28-pin SPDIP 28-pin SOIC 28-pin SSOP 28-pin QFN 28-pin UQFN
I/O Ports	A,B,C,E ⁽¹⁾	A,B,C,E ⁽¹⁾
12-Bit Analog-to-Digital Conversion Module (ADC ²) with Computation Accelerator	5 internal 24 external	5 internal 24 external
Capture/Compare/PWM Modules (CCP)	4	
10-Bit Pulse-Width Modulator (PWM)	4	
Timers (16-/8-bit)	4/3	
Serial Communications	2 UARTs with DMX/DALI/LIN, 2 I ² C, 1 SPI	
Complementary Waveform Generator (CWG)	3	
Zero-Cross Detect (ZCD)	1	
Data Signal Modulator (DSM)	1	
Signal Measurement Timer (SMT)	2

16-bit CRC with Scanner	Yes	
Programmable High/Low-Voltage Detect (HLVD)	Yes	
Resets (and Delays)	POR, Programmable BOR, RESET Instruction, Stack Overflow, Stack Underflow (PWRT, OST), MCLR, WDT, MEMV	
Instruction Set	81 Instructions; 87 with Extended Instruction Set enabled	
Maximum Operating Frequency	64 MHz	

Note 1: PORTE contains the single RE3 input-only pin.

1.3 Register and Bit naming conventions

1.3.1 REGISTER NAMES

When there are multiple instances of the same peripheral in a device, the peripheral control registers will be depicted as the concatenation of a peripheral identifier, peripheral instance, and control identifier. The control registers section will show just one instance of all the register names with an 'x' in the place of the peripheral instance number. This naming convention may also be applied to peripherals when there is only one instance of that peripheral in the device to maintain compatibility with other devices in the family that contain more than one.

1.3.2 BIT NAMES

There are two variants for bit names:

- Short name: Bit function abbreviation
- Long name: Peripheral abbreviation + short name

1.3.2.1 Short Bit Names

Short bit names are an abbreviation for the bit function. For example, some peripherals are enabled with the EN bit. The bit names shown in the registers are the short name variant.

Short bit names are useful when accessing bits in C programs. The general format for accessing bits by the short name is *RegisterName*bits.*ShortName*. For example, the enable bit, EN, in the T0CON0 register can be set in C programs with the instruction `T0CON0bits.EN = 1`.

Short names are generally not useful in assembly programs because the same name may be used by different peripherals in different bit positions. When this occurs, during the include file generation, all instances of that short bit name are appended with an underscore plus the name of the register in which the bit resides to avoid naming contentions.

1.3.2.2 Long Bit Names

Long bit names are constructed by adding a peripheral abbreviation prefix to the short name. The prefix is unique to the peripheral thereby making every long bit name unique. The long bit name for the Timer0 enable bit is the Timer0 prefix, T0, appended with the enable bit short name, EN, resulting in the unique bit name T0EN.

Long bit names are useful in both C and assembly programs. For example, in C the T0CON0 enable bit can be set with the `T0EN = 1` instruction. In assembly, this bit can be set with the `BSF T0CON0, T0EN` instruction.

1.3.2.3 Bit Fields

Bit fields are two or more adjacent bits in the same register. For example, the four Least Significant bits of the T0CON0 register contain the output prescaler select bits. The short name for this field is OUTPS and the long name is T0OUTPS. Bit field access is only possible in C programs. The following example demonstrates a C program instruction for setting the Timer0 output prescaler to the 1:6 Postscaler:

```
T0CON0bits.OUTPS = 0x5;
```

Individual bits in a bit field can also be accessed with long and short bit names. Each bit is the field name appended with the number of the bit position within the field. For example, the Most Significant mode bit has the short bit name OUTPS3. The following two examples demonstrate assembly program sequences for setting the Timer0 output prescaler to 1:6 Postscaler:

Example 1:

```
MOVLW  ~(1<<OUTPS3 | 1<<OUTPS1)
ANDWF  T0CON0,F
MOVLW  1<<OUTPS2 | 1<<OUTPS0
IORWF  T0CON0,F
```

Example 2:

```
BCF    T0CON0,OUTPS3
BSF    T0CON0,OUTPS2
BCF    T0CON0,OUTPS1
BSF    T0CON0,OUTPS0
```

1.3.3 REGISTER AND BIT NAMING EXCEPTIONS

1.3.3.1 Status, Interrupt, and Mirror Bits

Status, interrupt enables, interrupt flags, and mirror bits are contained in registers that span more than one peripheral. In these cases, the bit name shown is unique so there is no prefix or short name variant.

2.0 GUIDELINES FOR GETTING STARTED WITH PIC18(L)F25/26K83 MICROCONTROLLERS

2.1 Basic Connection Requirements

Getting started with the PIC18(L)F25/26K83 family of 8-bit microcontrollers requires attention to a minimal set of device pin connections before proceeding with development.

The following pins must always be connected:

- All VDD and VSS pins (see [Section 2.2 “Power Supply Pins”](#))
- $\overline{\text{MCLR}}$ pin (see [Section 2.3 “Master Clear \(MCLR Pin\)”](#))

These pins must also be connected if they are being used in the end application:

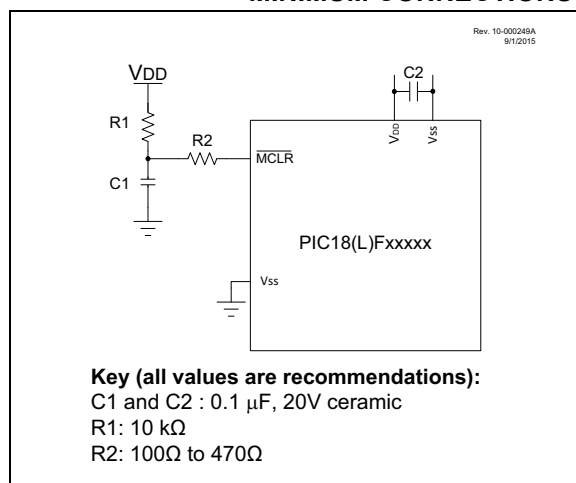

- ICSPCLK/ICSPDAT pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see [Section 2.4 “ICSP™ Pins”](#))
- OSCI and OSCO pins when an external oscillator source is used (see [Section 2.5 “External Oscillator Pins”](#))

Additionally, the following pins may be required:

- VREF+/VREF- pins are used when external voltage reference for analog modules is implemented

The minimum mandatory connections are shown in [Figure 2-1](#).

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTIONS

2.2 Power Supply Pins

2.2.1 DECOUPLING CAPACITORS

The use of decoupling capacitors on every pair of power supply pins (VDD and VSS) is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A 0.1 μF (100 nF), 10-20V capacitor is recommended. The capacitor should be a low-ESR device, with a resonance frequency in the range of 200 MHz and higher. Ceramic capacitors are recommended.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is no greater than 0.25 inch (6 mm).
- **Handling high-frequency noise:** If the board is experiencing high-frequency noise (upward of tens of MHz), add a second ceramic type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 μF to 0.001 μF . Place this second capacitor next to each primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible (e.g., 0.1 μF in parallel with 0.001 μF).
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB trace inductance.

2.2.2 TANK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits, including microcontrollers, to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device, and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 μF to 47 μF .

2.3 Master Clear ($\overline{\text{MCLR}}$) Pin

The $\overline{\text{MCLR}}$ pin provides two specific device functions: Device Reset, and Device Programming and Debugging. If programming and debugging are not required in the end application, a direct connection to V_{DD} may be all that is required. The addition of other components, to help increase the application's resistance to spurious Resets from voltage sags, may be beneficial. A typical configuration is shown in [Figure 2-1](#). Other circuit designs may be implemented, depending on the application requirements.

During programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the $\overline{\text{MCLR}}$ pin. Consequently, specific voltage levels (V_{IH} and V_{IL}) and fast signal transitions must not be adversely affected. Therefore, specific values of $R1$ and $C1$ will need to be adjusted based on the application and PCB requirements. For example, it is recommended that the capacitor, $C1$, be isolated from the $\overline{\text{MCLR}}$ pin during programming and debugging operations by using a jumper ([Figure 2-2](#)). The jumper is replaced for normal run-time operations.

Any components associated with the $\overline{\text{MCLR}}$ pin should be placed within 0.25 inch (6 mm) of the pin.

2.4 ICSP™ Pins

The ICSPCLK and ICSPDAT pins are used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of ohms, not to exceed 100Ω.

Pull-up resistors, series diodes and capacitors on the ICSPCLK and ICSPDAT pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits, and pin input voltage high (V_{IH}) and input low (V_{IL}) requirements.

For device emulation, ensure that the “Communication Channel Select” (i.e., ICSPCLK/ICSPDAT pins), programmed into the device, matches the physical connections for the ICSP to the Microchip debugger/emulator tool.

For more information on available Microchip development tools connection requirements, refer to [Section 44.0 “Development Support”](#).

FIGURE 2-2: EXAMPLE OF $\overline{\text{MCLR}}$ PIN CONNECTIONS

2.5 External Oscillator Pins

Many microcontrollers have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to [Section 7.0 “Oscillator Module \(with Fail-Safe Clock Monitor\)”](#) for details).

The oscillator circuit should be placed on the same side of the board as the device. Place the oscillator circuit close to the respective oscillator pins with no more than 0.5 inch (12 mm) between the circuit components and the pins. The load capacitors should be placed next to the oscillator itself, on the same side of the board.

Use a grounded copper pour around the oscillator circuit to isolate it from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed.

Layout suggestions are shown in [Figure 2-3](#). In-line packages may be handled with a single-sided layout that completely encompasses the oscillator pins. With fine-pitch packages, it is not always possible to completely surround the pins and components. A suitable solution is to tie the broken guard sections to a mirrored ground layer. In all cases, the guard trace(s) must be returned to ground.

In planning the application's routing and I/O assignments, ensure that adjacent port pins, and other signals in close proximity to the oscillator, are benign (i.e., free of high frequencies, short rise and fall times, and other similar noise).

For additional information and design guidance on oscillator circuits, refer to these Microchip Application Notes, available at the corporate website (www.microchip.com):

- AN826, “Crystal Oscillator Basics and Crystal Selection for rPIC™ and PICmicro® Devices”
- AN849, “Basic PICmicro® Oscillator Design”
- AN943, “Practical PICmicro® Oscillator Analysis and Design”
- AN949, “Making Your Oscillator Work”

2.6 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic low state. Alternatively, connect a 1 kΩ to 10 kΩ resistor to Vss on unused pins and drive the output to logic low.

FIGURE 2-3: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT

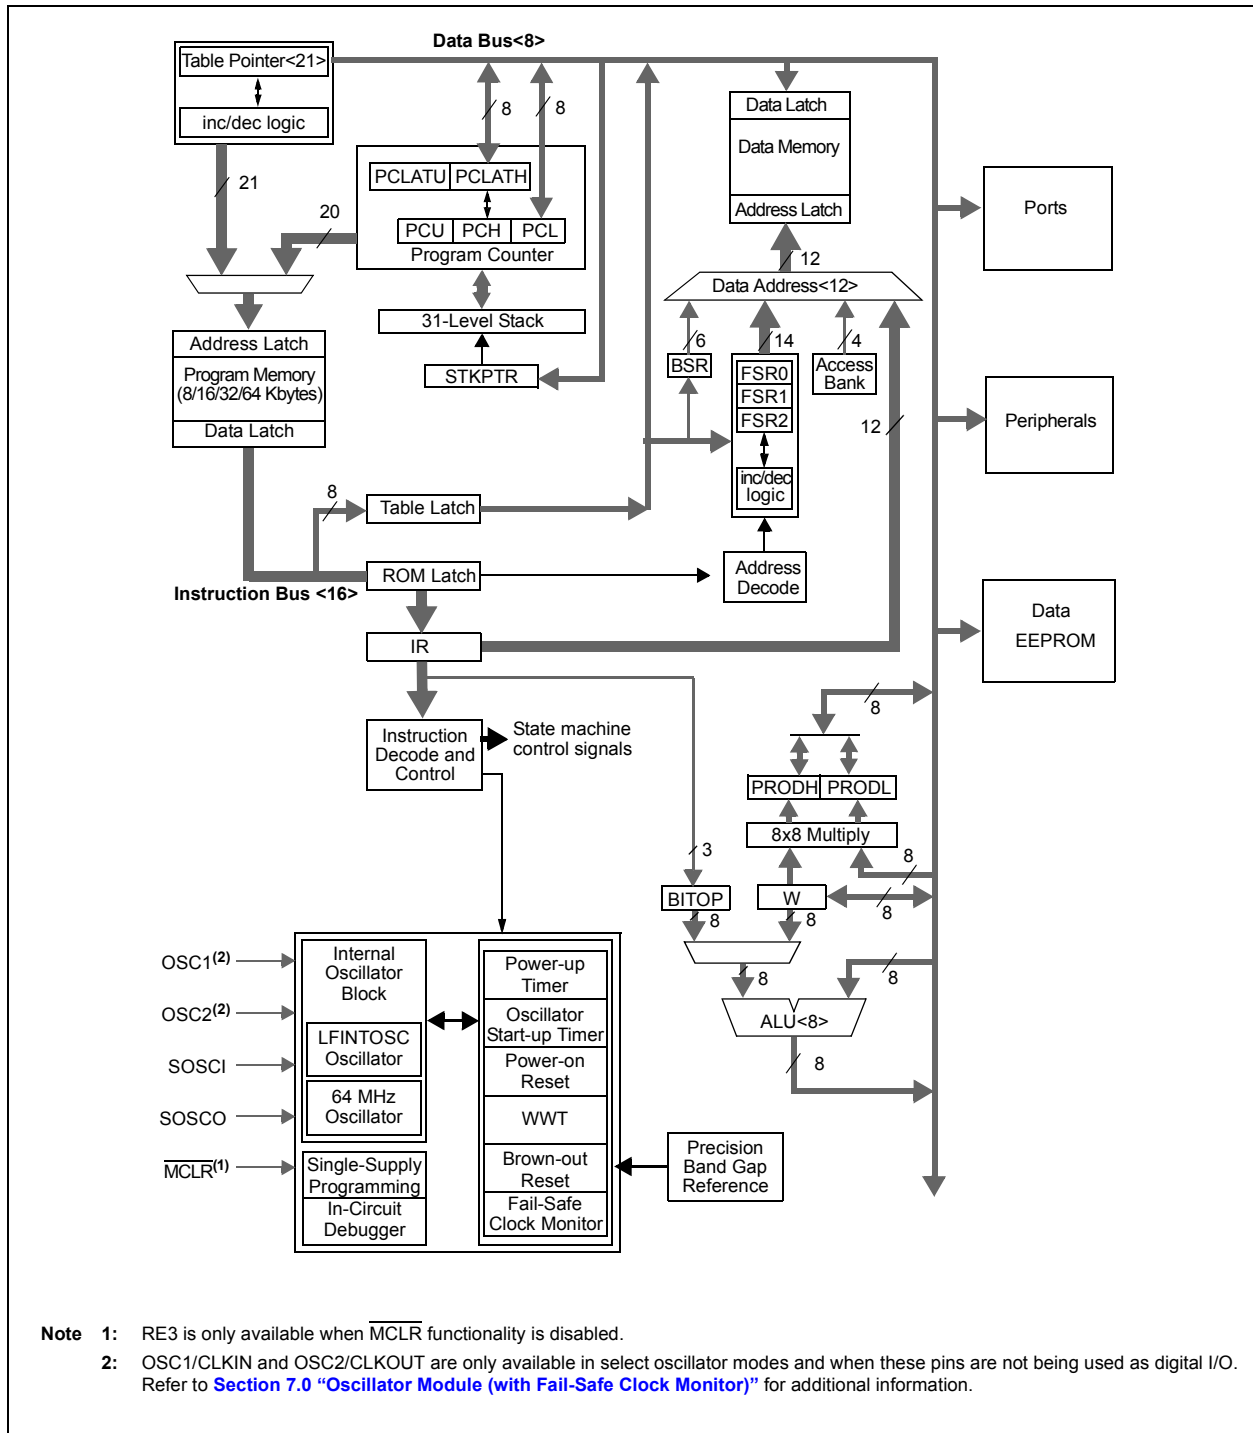

3.0 PIC18 CPU

This family of devices contains a PIC18 8-bit CPU core based on the modified Harvard architecture. The PIC18 CPU supports:

- System Arbitration which decides memory access allocation depending on user priorities
- Vectored Interrupt capability with automatic two level deep context saving
- 31-level deep hardware stack with overflow and underflow reset capabilities
- Support Direct, Indirect, and Relative Addressing modes
- 8x8 Hardware Multiplier

PIC18(L)F25/26K83

FIGURE 3-1: PIC18(L)F25/26K83 FAMILY BLOCK DIAGRAM

3.1 System Arbitration

The System Arbiter resolves memory access between the System Level Selections (i.e., Main, Interrupt Service Routine) and Peripheral Selection (i.e., DMA and Scanner) based on user-assigned priorities. Each of the system level and peripheral selections has its own priority selection registers. Memory access priority is resolved using the number written to the corresponding Priority registers, 0 being the highest priority and 4 the lowest. The default priorities are listed in [Table 3-1](#).

In case the user wants to change priorities, ensure each Priority register is written with a unique value from 0 to 4.

TABLE 3-1: DEFAULT PRIORITIES

Selection		Priority register Reset value
System Level	ISR	0
	MAIN	1
Peripheral	DMA1	2
	DMA2	3
	SCANNER	4

3.1.1 PRIORITY LOCK

The System arbiter grants memory access to the peripheral selections (DMAx, Scanner) when the PRLOCKED bit (PRLOCK Register) is set.

Priority selections are locked by setting the PRLOCKED bit of the PRLOCK register. Setting and clearing this bit requires a special sequence as an extra precaution against inadvertent changes. Examples of setting and clearing the PRLOCKED bit are shown in [Example 3-1](#) and [Example 3-2](#).

EXAMPLE 3-1: PRIORITY LOCK SEQUENCE

```
; Disable interrupts
BCF INTCON0,GIE

; Bank to PRLOCK register
BANKSEL PRLOCK
MOVLW 55h

; Required sequence, next 4
instructions
MOVWF PRLOCK
MOVLW AAh
MOVWF PRLOCK
; Set PRLOCKED bit to grant memory
access to peripherals
BSF PRLOCK,0

; Enable Interrupts
BSF INTCON0,GIE
```

EXAMPLE 3-2: PRIORITY UNLOCK SEQUENCE

```
; Disable interrupts
BCF INTCON0,GIE

; Bank to PRLOCK register
BANKSEL PRLOCK
MOVLW 55h

; Required sequence, next 4
instructions
MOVWF PRLOCK
MOVLW AAh
MOVWF PRLOCK
; Clear PRLOCKED bit to allow changing
priority settings
BCF PRLOCK,0

; Enable Interrupts
BSF INTCON0,GIE
```

3.2 Memory Access Scheme

The user can assign priorities to both system level and peripheral selections based on which the system arbiter grants memory access. Let us consider the following priority scenarios between ISR, MAIN, and Peripherals.

Note: It is always required that the ISR priority be higher than Main priority.

3.2.1 ISR PRIORITY > MAIN PRIORITY > PERIPHERAL PRIORITY

When the Peripheral Priority (DMAx, Scanner) is lower than ISR and MAIN Priority, and the peripheral requires:

1. Access to the Program Flash Memory, then the peripheral waits for an instruction cycle in which the CPU does not need to access the PFM (such as a branch instruction) and uses that cycle to do its own Program Flash Memory access, unless a PFM Read/Write operation is in progress.
2. Access to the SFR/GPR, then the peripheral waits for an instruction cycle in which the CPU does not need to access the SFR/GPR (such as MOVLW, CALL, NOP) and uses that cycle to do its own SFR/GPR access.
3. Access to the Data EEPROM, then the peripheral has access to Data EEPROM unless a Data EEPROM Read/Write operation is being performed.

This results in the lowest throughput for the peripheral to access the memory, and does so without any impact on execution times.

3.2.2 PERIPHERAL PRIORITY > ISR PRIORITY > MAIN PRIORITY

When the Peripheral Priority (DMAx, Scanner) is higher than ISR and MAIN Priority, the CPU operation is stalled when the peripheral requests memory.

The CPU is held in its current state until the peripheral completes its operation. Since the peripheral requests access to the bus, the peripheral cannot be disabled until it completes its operation.

This results in the highest throughput for the peripheral to access the memory, but has the cost of stalling other execution while it occurs.

PIC18(L)F25/26K83

3.2.3 ISR PRIORITY > PERIPHERAL PRIORITY > MAIN PRIORITY

In this case, interrupt routines and peripheral operation (DMAx, Scanner) will stall the CPU. Interrupt will preempt peripheral operation. This results in lowest interrupt latency and highest throughput for the peripheral to access the memory.

3.2.4 PERIPHERAL 1 PRIORITY > ISR PRIORITY > MAIN PRIORITY > PERIPHERAL 2 PRIORITY

In this case, the Peripheral 1 will stall the execution of the CPU. However, Peripheral 2 can access the memory in cycles unused by Peripheral 1.

The operation of the System Arbiter is controlled through the following registers:

REGISTER 3-1: ISRPR: INTERRUPT SERVICE ROUTINE PRIORITY REGISTER

4.0 MEMORY ORGANIZATION

There are three types of memory in PIC18 enhanced microcontroller devices:

- Program Flash Memory
- Data RAM
- Data EEPROM

The Program Memory Flash and data RAM share the same bus, while data EEPROM uses a separate bus. This allows for concurrent access of the memory spaces.

Additional detailed information on the operation of the Program Flash Memory and Data EEPROM Memory is provided in [Section 13.0 “Nonvolatile Memory \(NVM\) Control”](#).

4.1 Program Flash Memory Organization

PIC18 microcontrollers implement a 21-bit Program Counter, which is capable of addressing a 2 Mbyte program memory space. Accessing any unimplemented memory will return all '0's (a NOP instruction).

These devices contains the following:

- PIC18(L)F25K83: 32 Kbytes of Flash memory, up to 16,384 single-word instructions
- PIC18(L)F26K83: 64 Kbytes of Flash memory, up to 32,768 single-word instructions

The Reset vector for the device is at address 000000h. PIC18(L)F25/26K83 devices feature a vectored interrupt controller with a dedicated interrupt vector table in the program memory, see [Section 9.0 “Interrupt Controller”](#).

Note: For memory information on this family of devices, see [Table 4-1](#) and [Table 4-3](#).

4.2 Memory Access Partition (MAP)

Program Flash Memory is partitioned into:

- Application Block
- Boot Block, and
- Storage Area Flash (SAF) Block

4.2.1 APPLICATION BLOCK

Application Block is where the user's program resides by default. Default settings of the Configuration bits ($\overline{\text{BBEN}} = 1$ and $\overline{\text{SAFEN}} = 1$) assign all memory in the Program Flash Memory area to the Application Block. The $\overline{\text{WRTAPP}}$ Configuration bit is used to protect the Application Block.

4.2.2 BOOT BLOCK

Boot Block is an area in program memory that is ideal for storing bootloader code. Code placed in this area can be executed by the CPU. The Boot Block can be write-protected, independent of the main Application Block. The Boot Block is enabled by the $\overline{\text{BBEN}}$ bit and size is based on the value of the BBSIZE bits of Configuration word ([Register 5-7](#)), see [Table 5-1](#) for Boot Block sizes.

The $\overline{\text{WRTB}}$ Configuration bit is used to write-protect the Boot Block.

4.2.3 STORAGE AREA FLASH

Storage Area Flash (SAF) is the area in program memory that can be used as data storage. SAF is enabled by the $\overline{\text{SAFEN}}$ bit of the Configuration word in [Register 5-7](#). If enabled, the code placed in this area cannot be executed by the CPU. The SAF block is placed at the end of memory and spans 256 bytes. The $\overline{\text{WRTSAF}}$ Configuration bit is used to write-protect the Storage Area Flash.

Note: If write-protected locations are written from NVMCON registers, memory is not changed and the WRERR bit defined in [Register 13-1](#) is set.
