Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

PL133-47

Low-Power 2.25V to 3.63V DC to 150MHz 1:4 Fanout Buffer IC

FEATURES

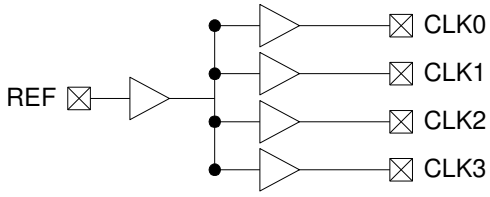
- 1:4 LVCMOS output fanout buffer for DC to150MHz
- Low Additive Phase Jitter of 60fs RMS
- 8mA Output Drive Strength
- Low power consumption for portable applications
- Low input-output delay
- Output-Output skew less than 250ps
- 2.5V to 3.3V, ±10% operation
- Operating temperature range from -40°C to 85°C
- Available in 8-Pin SOP GREEN/RoHS package

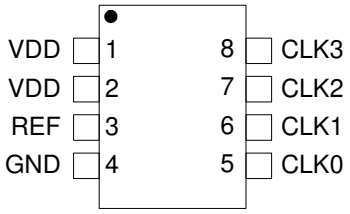
DESCRIPTION

The PL133-47 is an advanced fanout buffer design for high performance, low-power, small form factor applications. The PL133-47 accepts a reference clock input from DC to 150MHz and provides 4 outputs of the same frequency.

The PL133-47 is offered in a SOP-8L package and it offers the best phase noise, additive jitter performance, and lowest power consumption of any comparable IC.

BLOCK DIAGRAM AND PACKAGE PINOUT





SOP-8L

Low-Power 2.25V to 3.63V DC to 150MHz 1:4 Fanout Buffer IC

PIN DESCRIPTIONS

Name	SOP-8L	Type	Description
REF	3	I	Input reference frequency.
CLK0	5	O	Buffered clock output
CLK1	6	O	Buffered clock output
CLK2	7	O	Buffered clock output
CLK3	8	O	Buffered clock output
VDD	1, 2	P	VDD connection
GND	4	P	GND connection

LAYOUT RECOMMENDATIONS

The following guidelines are to assist you with a performance optimized PCB design:

Signal Integrity and Termination Considerations

- Keep traces short!
- Trace = Inductor. With a capacitive load this equals ringing!
- Long trace = Transmission Line. Without proper termination this will cause reflections (looks like ringing).
- Design long traces (> 1 inch) as “striplines” or “microstrips” with defined impedance.
- Match trace at one side to avoid reflections bouncing back and forth.

Decoupling and Power Supply Considerations

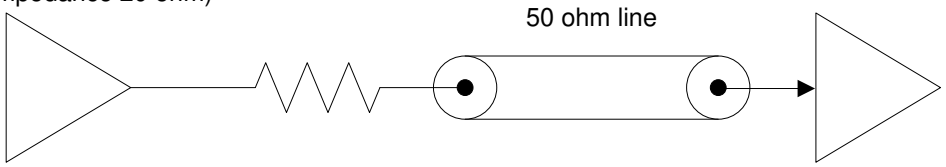
- Place decoupling capacitors as close as possible to the VDD pin(s) to limit noise from the power supply
- Addition of a ferrite bead in series with VDD can help prevent noise from other board sources
- Value of decoupling capacitor is frequency dependant. Typical values to use are 0.1μF for designs using frequencies < 50MHz and 0.01μF for designs using frequencies > 50MHz.

Typical CMOS termination

Place Series Resistor as close as possible to CMOS output

CMOS Output Buffer
(Typical buffer impedance 20 ohm)

To CMOS Input



Connect a 33 ohm series resistor at each of the output clocks to enhance the stability of the output signal

Low-Power 2.25V to 3.63V DC to 150MHz 1:4 Fanout Buffer IC

ABSOLUTE MAXIMUM CONDITIONS

Supply Voltage to Ground Potential ..... –0.5V to 4.6V
DC Input Voltage ..... V_{SS} – 0.5V to 4.6V
Storage Temperature ..... –65°C to 150°C
Junction Temperature..... 150°C
Static Discharge Voltage
(per MIL-STD-883, Method 3015).....> 2000V

OPERATING CONDITIONS

Parameter	Description	Min.	Max.	Unit
V_{DD}	Supply Voltage	2.25	3.63	V
T_A	Commercial Operating Temperature (ambient temperature)	0	70	°C
	Industrial Operating Temperature (ambient temperature)	-40	85	°C
C_L	Load Capacitance, below 100 MHz	–	30	pF
	Load Capacitance between 100 MHz and 134 MHz	–	10	pF
	Load Capacitance, above 134 MHz	–	5	pF
C_{IN}	Input Capacitance	–	7	pF
REF, CLK[1:6]	Operating Frequency, Input=Output	DC	150	MHz
t_{PU}	Power-up time for all V_{DD}s to reach minimum specified voltage (power ramps must be monotonic)	0.05	50	ms

ELECTRICAL CHARACTERISTICS (Commercial and Industrial Temperature Devices)

Parameter	Description	Test Conditions	Min.	Max.	Unit
V_{IL}	Input LOW Voltage [1]		–	0.8	V
V_{IH}	Input HIGH Voltage [1]		2.0	–	V
I_{IL}	Input LOW Current	V_{IN} = 0V	–	50	µA
I_{IH}	Input HIGH Current	V_{IN} = V_{DD}	–	100	µA
V_{OL}	Output LOW Voltage [2]	I_{OL} = 8 mA	–	0.4	V
V_{OH}	Output HIGH Voltage [2]	I_{OH} = –8 mA	2.4	–	V
I_{DD}	Supply Current	66.67MHz with unloaded outputs	–	32	mA

SWITCHING CHARACTERISTICS (Commercial and Industrial Temperature Devices) [3]

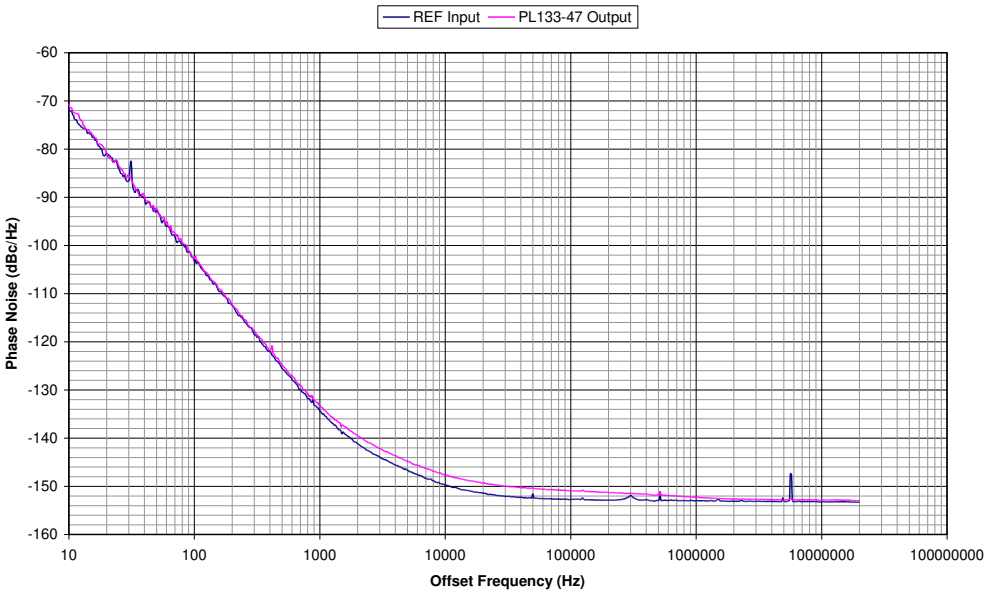
Parameter	Description	Test Conditions	Min.	Typ.	Max.	Unit
	Duty Cycle [2] = t2 ÷ t1	Measured at 1.4V, Input is 50%	40	50	60	%
t_3	Rise Time [2]	Measured between 0.8V and 2.0V	–	–	1.5	ns
t_4	Fall Time [2]	Measured between 0.8V and 2.0V	–	–	1.5	ns
t_5	Output to Output Skew [2]	All outputs equally loaded	–	–	250	ps
t_6	Propagation Delay, REF Rising Edge to CLKX Rising Edge [2]	Measured at $V_{DD}/2$	1	5	9.2	ns

Notes:
1. REF input has a threshold voltage of $V_{DD}/2$
2. Parameter is guaranteed by design and characterization. Not 100% tested in production.
3. All parameters are specified with loaded outputs.

NOISE CHARACTERISTICS (Commercial and Industrial Temperature Devices)

Parameter	Description	Test Conditions	Min.	Typ.	Max.	Unit
	Additive Phase Jitter	V_{DD}=3.3V, Frequency=100MHz Offset=12KHz ~ 20MHz		60		fs

PL133-47 Additive Phase Jitter:
VDD=3.3V, CLK=100MHz, Integration Range 12KHz to 20MHz: 0.059ps typical.



When a buffer is used to pass a signal then the buffer will add a little bit of its own noise. The phase noise on the output of the buffer will be a little bit more than the phase noise in the input signal. To quantify the noise addition in the buffer we compare the Phase Jitter numbers from the input and the output. The difference is called "Additive Phase Jitter". The formula for the Additive Phase Jitter is as follows:

$$\text{Additive Phase Jitter} = \sqrt{(\text{Output Phase Jitter})^2 - (\text{Input Phase Jitter})^2}$$
