

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## PS11013

### INTEGRATED FUNCTIONS AND FEATURES

- Converter bridge for 3 phase AC-to-DC power conversion.
- Circuit for dynamic braking of motor regenerative energy.
- 3-phase IGBT inverter bridge configured by the latest 3rd generation IGBT and diode technology.
- Inverter output current capability  $I_O$  (Note 1):

Type Name	100% load	150% over load
PS11013	3.0A (rms)	4.5A (rms), 1min

(Note 1) : The inverter output current is assumed to be sinusoidal and the peak current value of each of the above loading cases is defined as :  $I_{OP} = I_O \times \sqrt{2}$

### INTEGRATED DRIVE, PROTECTION AND SYSTEM CONTROL FUNCTIONS:

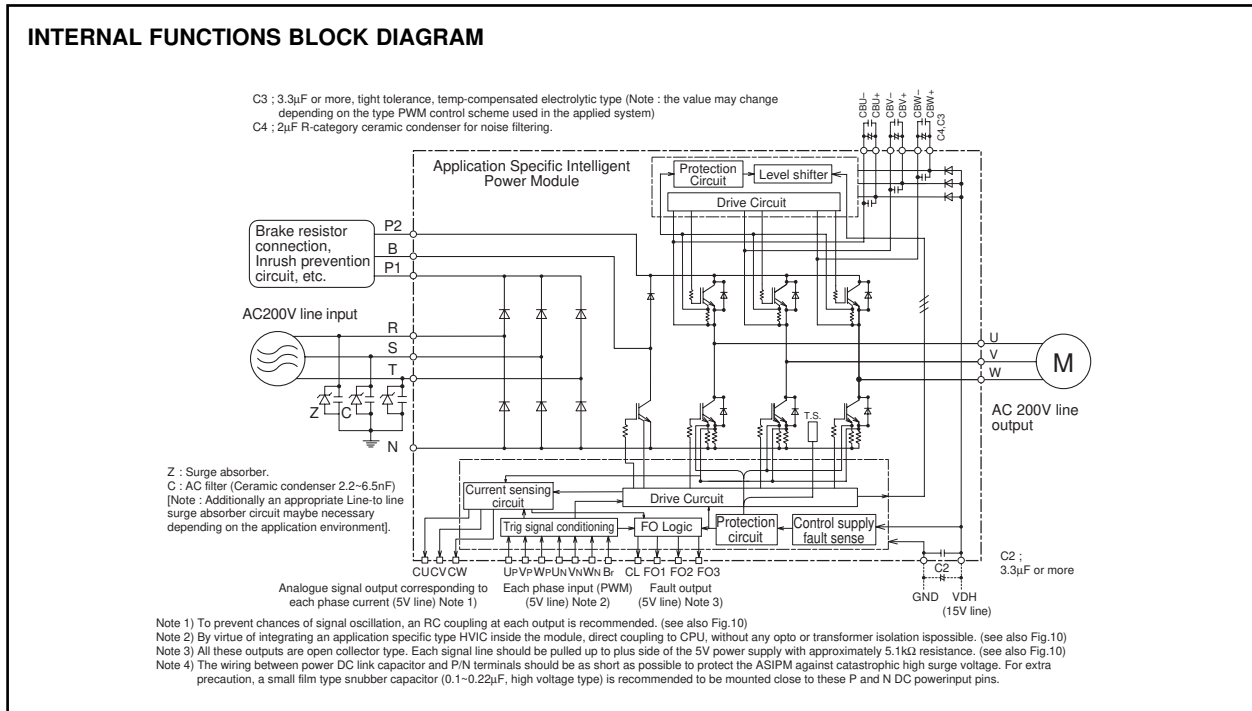

- For inverter side upper-leg IGBTs : Drive circuit, High voltage isolated high-speed level shifting, Short circuit protection (SC).  
Bootstrap circuit supply scheme (single drive power supply) and Under voltage protection (UV).
- For inverter side lower-leg IGBTs : Drive circuit, Short circuit protection (SC).  
Control supply circuit under- & over- voltage protection (OV/UV).  
System over temperature protection (OT). Fault output signaling circuit (FO) and Current limit warning signal output (CL).
- For Brake circuit IGBT : Drive circuit
- Warning and Fault signaling :
  - FO1 : Short circuit protection for lower-leg IGBTs and Input interlocking against spurious arm shoot-through.
  - FO2 : N-side control supply abnormality locking (OV/UV).
  - FO3 : System over-temperature protection (OT).
  - CL : Warning for inverter current overload condition
- For system feedback control : Analogue signal feedback reproducing actual inverter output phase currents (3 $\phi$ ).
- Input Interface : 5V CMOS/TTL compatible, Schmitt trigger input, and Arm-Shoot-Through interlock protection.

(Note 3) : (a) Allowable minimum input on-pulse width : This item applies to P-side circuit only.

(b) Allowable maximum input on-pulse width : This item applies to both P-side and N-side circuits excluding the brake circuit.

(Note4) : CL output : The "current limit warning (CL) operation circuit outputs warning signal whenever the arm current exceeds this limit. The circuit is reset automatically by the next input signal and thus, it operates on a pulse-by-pulse scheme.

(Note5) : The short circuit protection works instantaneously when a high short circuit current flows through an internal IGBT rising up momentarily. The protection function is, thus meant primarily to protect the ASIPM against short circuit distraction. Therefore, this function is not recommended to be used for any system load current regulation or any over load control as this might, cause a failure due to excessive temperature rise. Instead, the analogue current output feature or the over load warning feature (CL) should be appropriately used for such current regulation or over load control operation. In other words, the PWM signals to the ASIPM should be shut down, in principle, and not to be restarted before the junction temperature would recover to normal, as soon as a fault is feed back from its FO<sub>1</sub> pin of the ASIPM indicating a short circuit situation.

Fig. 4 OUTPUT CURRENT ANALOGUE SIGNALING LINEARITY

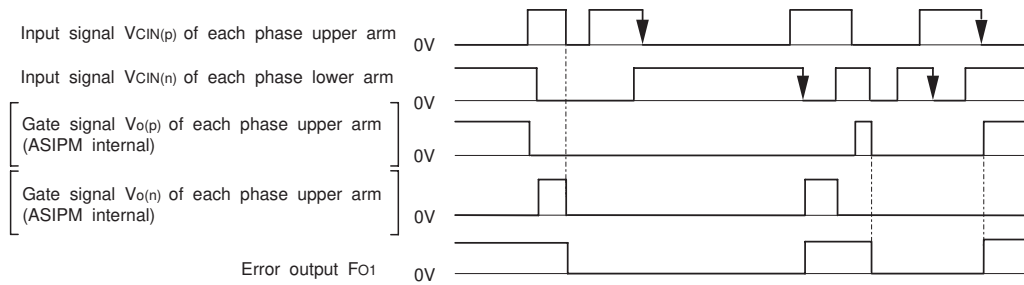

Fig. 5 OUTPUT CURRENT ANALOGUE SIGNALING "DATA HOLD" DEFINITION

Note ; Ringing happens around the point where the signal output voltage changes state from "analogue" to "data hold" due to test circuit arrangement and instrumental trouble. Therefore, the rate of change is measured at a 5 μs delayed point.

Fig. 6 INPUT INTERLOCK OPERATION TIMING CHART

Note : Input interlock protection circuit ; It is operated when the input signals for any upper-arm / lower-arm pair of a phase are simultaneously in "LOW" level.

By this interlocking, both upper and lower IGBTs of this mal-triggered phase are cut off, and "Fo" signal is outputted. After an "input interlock" operation the circuit is latched. The "Fo" is reset by the high-to-low going edge of either an upper-leg, or a lower-leg input, whichever comes in later.

Fig. 7 TIMING CHART AND SHORT CIRCUIT PROTECTION OPERATION

Note : Short circuit protection operation. The protection operates with "Fo" flag and reset on a pulse-by-pulse scheme. The protection by gate shutdown is given only to the IGBT that senses an overload (excluding the IGBT for the "Brake").

Fig. 8 INVERTER OUTPUT ANALOGUE CURRENT SENSING AND SIGNALING TIMING CHART

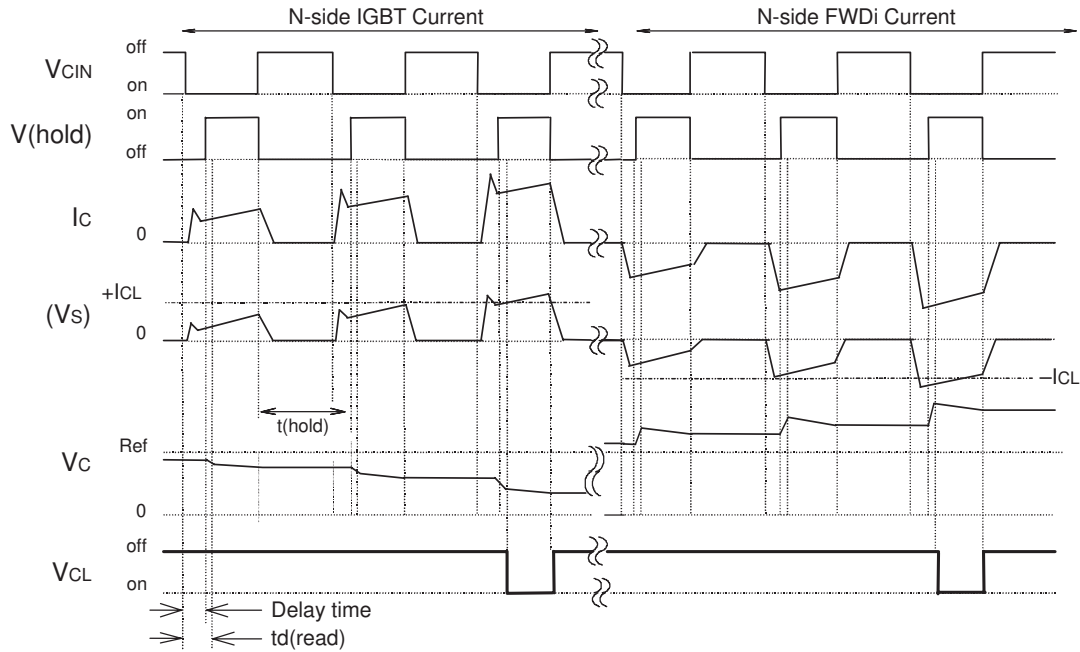

Fig. 9 START-UP SEQUENCE

Normally at start-up, Fo and CL output signals will be pulled-up High to Supply voltage (OFF level); however, FO1 output may fall to Low (ON) level at the instant of the first ON input pulse to an N-Side IGBT. This can happen particularly when the boot-strap capacitor is of large size. FO1 resetting sequence (together with the boot-strap charging sequence) is explained in the following graph

**a) Boot-strap charging scheme :**

Apply a train of short ON pulses at all N-IGBT input pins for adequate charging (pulse width = approx.  $20\mu s$  number of pulses = 10 ~ 500 depending on the boot-strap capacitor size)

**b) Fo1 resetting sequence:**

Apply ON signals to the following input pins : Br  $\rightarrow$  Un/Vn/Wn  $\rightarrow$  Up/Vp/Wp in that order.
