

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

### INTEGRATED POWER FUNCTIONS

1200V/10A low-loss 4<sup>th</sup> generation IGBT inverter bridge  
for 3 phase DC-to-AC power conversion

### INTEGRATED DRIVE, PROTECTION AND SYSTEM CONTROL FUNCTIONS

- For upper-leg IGBTs : Drive circuit, High voltage high-speed level shifting, Control supply under-voltage (UV) protection.
- For lower-leg IGBTs : Drive circuit, Control supply under-voltage protection (UV), Short circuit protection (SC).
- Fault signaling : Corresponding to an SC fault (Lower-side IGBT) or a UV fault (Lower-side supply).
- Input interface : 5V line CMOS/TTL compatible (High active logic).

## APPLICATION

AC400V 0.2kW~0.75kW inverter drive for small power motor control.

**[A] Short-Circuit Protection (Lower-arms only with the external shunt resistor and CR filter)**

- a1. Normal operation : IGBT ON and carrying current.
- a2. Short circuit current detection (SC trigger).
- a3. IGBT gate hard interruption.
- a4. IGBT turns OFF.
- a5. FO output with a fixed pulse width determined by the external capacitor C<sub>FO</sub>.
- a6. Input = "L" : IGBT OFF
- a7. Input = "H" :
- a8. IGBT OFF state in spite of input "H".

**[B] Under-Voltage Protection (Lower-arm, UVd)**

- b1. Control supply voltage rising : After the voltage level reaches UV<sub>Dr</sub>, the circuits start to operate when next input is applied.
- b2. Normal operation : IGBT ON and carrying current.
- b3. Under voltage trip (UV<sub>Dt</sub>).
- b4. IGBT OFF in spite of control input condition.
- b5. F<sub>o</sub> keeps output during the UV period, however, F<sub>o</sub> pulse is not less than the fixed width for very short UV interval.
- b6. Under voltage reset (UV<sub>Dr</sub>).
- b7. Normal operation : IGBT ON and carrying current.

**[C] Under-Voltage Protection (Upper-side, UVDB)**

- c1. Control supply voltage rises : After the voltage reaches UVDBr, the circuits start to operate when next input is applied.
- c2. Normal operation : IGBT ON and carrying current.
- c3. Under voltage trip (UVDBt).
- c4. IGBT OFF in spite of control input signal level, but there is no Fo signal output.
- c5. Under voltage reset (UVDBr).
- c6. Normal operation : IGBT ON and carrying current.

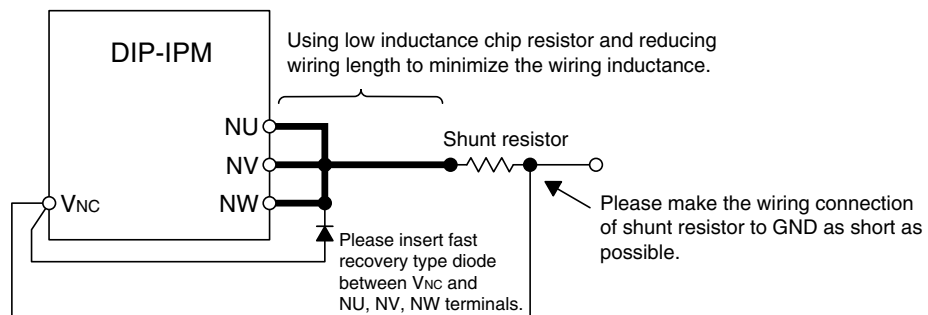

**Fig. 6 MCU I/O INTERFACE CIRCUIT**

**Note :** RC coupling at each input (parts shown dotted) may change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board.  
The DIP-IPM input signal section integrates a 2.5kΩ(min) pull-down resistor. Therefore, when using a external filtering resistor, pay attention to the turn-on threshold voltage requirement.

**Fig. 7 WIRING CONNECTION WITH 1 SHUNT RESISTOR**

For 3 shunt resistors connection, please refer to Fig.9.

Fig. 8 AN EXAMPLE OF TYPICAL DIP-IPM APPLICATION CIRCUIT WITH 1 SHUNT RESISTOR

- Note 1:** To avoid malfunction, the wiring of each input should be as short as possible. (less than 2-3cm)
- 2:** By virtue of integrating HVIC inside the module, direct coupling to MCU terminals without any opto-coupler or transformer isolation is possible.
- 3:** Fo output is open drain type. The signal line should be pulled up to the positive side of a 5V supply with an approximate 10kΩ resistor.
- 4:** Fo output pulse width (tFO) should be determined by connecting external capacitor C4 between CFO and Vnc terminals. (Example : tFO=2.4ms(typ.) at CFO=22nF)
- 5:** Input signal is High-Active type. There is a 2.5kΩ (Min.) resistor inside IC to pull down each input signal line to GND. When employing RC coupling circuits at each input, set up RC couple such that input signal agree with turn-off/turn-on threshold voltage.
- 6:** To prevent errors of the protection function, the wiring of A, B, C should be as short as possible.
- 7:** The time constant R5C1 of the protection circuit should be selected in the range of 1.5~2μs. SC interrupting time might vary with the wiring pattern.
- 8:** All capacitors should be mounted as close to the terminals of the DIP-IPM as possible.
- 9:** To prevent surge destruction, the wiring between the smoothing capacitor and the P&N1 terminals should be as short as possible. Generally a 0.1~0.22μF snubber between the P&N1 terminals is recommended.
- 10:** It is recommended to insert a Zener diode (24V/1W) between each pair of control supply terminals to prevent surge destruction.
- 11:** To prevent LVIC from surge destruction, it is recommended to mount a fast recovery type diode between Vnc and NU, NV, NW terminals.
