Description

The PT8A3290/1/2/3/4/5/6/7 is a mixed signal CMOS LSI chip designed as heating controller with help of external NTC (Negative Temperature Component). NTC open protection is implemented for device safety. This device can be used in both 120V and 240V power line supplier, as it will automatically adjust the heating power according to the power line voltage to avoid heating appliance damage or long heating time. The proportional control algorithm is designed in this product.

Functional Description

- **State description**

- **Reset**

The device will be of reset state after power-on.

- **Heating on**

The device will be of heating on state after heating-on button is on

- **Heating off**

This device enter heating-off state after its power-on reset or heating timer timeout, and all pins will be the same status as after power-on reset.

- **NTC open protection**

When NTC is open, NTC1 pin will be pulled low in the period of NTC open detected.

- **Timer**

Once IC enters Heating-on State, internal timer starts to count. When time is out after 216000 clock period, it will exit heating-on state. That is, in case of 60Hz CLK signal, the heating time is about 1 hour; and 1.2 hour for 50Hz.

In heating-on state, temperature is regulated to the selected temperature by the IC through NTC close control loop.

- **Control signal output**

When working in Heating-on state, Gate/LED output will be related to NTC1 input and CLK input amplitude.
