

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

PXD15-xxDxx Dual Output DC/DC Converter

9 to 75 Vdc input, 5 to 15 Vdc Dual Output, 15W

Features

- Low profile: 2.0X1.0X0.4 inches (50.8X25.4X10.2mm)
- 2:1 wide input voltage of 9-18, 18-36 or 36-75VDC
- 15 Watts output power
- Input to output isolation: 1600Vdc, min
- Operating case temperature range :100°C max
- Over-current protection, auto-recovery
- Output over voltage protection
- ISO 9001 certified manufacturing facilities
- UL60950-1, EN60950-1 and IEC60950-1 licensed
- CE Mark meet s2006/95/EC, 93/68/EEC and 2004/108/EC
- Compliant to RoHS EU directive 2002/95/EC

Applications

- Distributed power architectures
- Communication equipment
- Computer equipment

Option

- Positive logic & Negative logic Remote on/off

General Description

The PXD15-xxDxx dual output converter offers 15 watts of output power from a 2 x 1 x 0.4 inch package. This series has a 2:1 wide input voltage of 9-18, 18-36 or 36-75VDC.

Remote On/Off Control

The Remote ON/OFF Pin is used to turn on and off the DC/DC converter. The user must use a switch to control the logic voltage (high or low) level of the pin referenced to -Vin. The switch can be an open collector transistor, FET or Opto-Coupler. The switch must be capable of sinking up to 0.5 mA for a low-level logic voltage. High-level logic of the ON/OFF signal, the allowable leakage current of the switch at 12V is 0.5mA.

Remote ON/OFF Implementation Circuits

Isolated-Control Remote ON/OFF

Level Control Using TTL Output

Level Control Using Line Voltage

Positive logic structure used to turn on the DC/DC module when the ON/OFF pin is at high-level logic. A low-level logic is used for turn off.

When PXD15-xxSxx module is turned off at Low-level logic

Thermal Consideration

The power module operates in a variety of thermal environments. However, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the point as shown in the figure below. The temperature at this location should not exceed 100°C. When operating, adequate cooling must be provided to maintain the test point temperature at or below 100°C. Although the maximum point temperature of the power module is 100°C, limiting this temperature to a lower value will yield higher reliability.

Output Over Current Protection

When excessive output currents occur in the system, circuit protection is required on all converters. Normally, overload current is maintained at approximately 150 percent of rated current for PxD15-xxDxx series..

Hiccup-mode is a method used in a converter whose purpose is to protect the converter from being damaged during an over-current fault condition. It also enables the converter to restart when the fault is removed. There are other ways of protecting the converter when it is over-loaded, such as the maximum current limiting or the current foldback method.

One of the problems resulting from over current is that excessive heat may be generated in power devices; especially MOSFET and Schottky diodes and the temperature of these devices may exceed their specified limits. A protection mechanism has to be used to prevent these power devices from being damaged.

The operation of hiccup is as follows. When the current sense circuit sees an over-current event, the controller shuts off the converter for a given time and then tries to re-start the converter. If the over-load condition has been removed, the converter will start-up and operate normally; otherwise, the controller will see another over-current event and shut off the converter again, repeating the previous cycle. Hiccup operation has none of the drawbacks of the other two protection methods, although it's circuit is more complicated because it requires a timing circuit. The excess heat due to overload lasts for only a short duration in the hiccup cycle, hence the junction temperature of the power devices is much lower.

Short Circuit Protection

Continuous, hiccup and auto-recovery mode.

During short circuit, converter still shut down. The average current during this condition will be very low and the device can be safety in this condition.

Safety and Installation Instruction

Isolation consideration

The PXD15-xxDxx series features 1.6k Volt DC isolation from input to output, input to case, and output to case. The input to output resistance is greater than 10^9 ohms. Nevertheless, if the system using the converter needs to receive safety agency approval, certain rules must be followed in the design of the system using the model. In particular, all of the creepage and clearance requirements of the end-use safety requirement must be observed. These documents include UL-60950-1, EN60950-1 and CSA 22.2-960, although specific applications may have other or additional requirements.

Fusing Consideration

Caution: This converter is not internally fused. An input line fuse must always be used. This encapsulated converter can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of sophisticated power architecture. To maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a slow-blow fuse with maximum rating of 6.3 A. Based on the information provided in this data sheet on inrush energy and maximum DC input current, the same type of fuse with lower rating can be used. Refer to the fuse manufacturer's data for further information.

Minimum Load Requirement

10%(of full load) minimum load required. The 10% minimum load requirement is in order to meet all performance specifications. The PXD15-xxDxx series does not properly maintain regulation and operate under a no load condition. The output voltage drops off about 10%.

MTBF and Reliability

The MTBF of PXD15-xxDxx series of DC/DC converters has been calculated using:

1.MIL-HDBK-217F under the following conditions:

Nominal Input Voltage

$I_o = I_o, \text{max}$

$T_a = 25^\circ\text{C}$

The resulting figure for MTBF is 1.044×10^6 hours.

2.Bell-core TR-NWT-000332 Case I:

50% stress, Operating Temperature at 40°C $^\circ\text{C}$ (Ground fixed and controlled environment)

The resulting figure for MTBF is 2.041×10^6 hours.
