Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

tyco / Electronics

QHW050A1-Q, QHW075A1-Q, and QHW100A1-Q Power Modules; dc-dc Converters: 36 to 75 Vdc Input, 5 Vdc Output; 50 W to 100 W

Features

n Small size: 36.8 mm x 57.9 mm x 12.7 mm (1.45 in. x 2.28 in. x 0.50 in.)

n High power density

n Extra high efficiency: 87.5% typical

n Low output noise

n Constant frequency

n Metal baseplate

n 2:1 input voltage range

n Overvoltage and overcurrent, overtemperature protection

n Negative remote on/off

n Remote sense

n Adjustable output voltage

n *ISO** 9001 and *ISO* 14001 Certified manufacturing facilities

n *UL*[†]60950 Recognized, *CSA*[‡] C22.2 No. 60950-00 Certified, and *VDE* [§] 0805 (EN60950) Licensed

n CE mark meets 73/23/EEC and 93/68/EEC directives**

* *ISO* is a registered trademark of the International Organization for Standardization.
† *UL* is a registered trademark of Underwriters Laboratories, Inc.
‡ *CSA* is a registered trademark of Canadian Standards Association.
§ *VDE* is a trademark of Verband Deutscher Elektrotechniker e.V.
** This product is intended for integration into end-use equipment. All the required procedures for CE marking of end-use equipment should be followed. (The CE mark is placed on selected products.)

The QHW Series Power Modules use advanced, surface-mount technology and deliver high-quality, efficient, and compact dc-dc conversion.

Applications

n Distributed power architectures

n Communications equipment

n Computer equipment

Options

n Heat sinks available for extended operation

n Auto-restart after overtemperature, overvoltage, or overcurrent shutdown

n Case ground pin

n Short pins

Description

The QHW050A1-Q, QHW075A1-Q, and QHW100A1-Q Power Modules are dc-dc converters that operate over an input voltage range of 36 Vdc to 75 Vdc and provide a precisely regulated dc output. The outputs are fully isolated from the inputs, allowing versatile polarity configurations and grounding connections. The modules have maximum power ratings from 50 W to 100 W at a typical full-load efficiency of 87.5%.

The sealed modules offer a metal baseplate for excellent thermal performance. Threaded-through holes are provided to allow easy mounting or addition of a heat sink for high-temperature applications. The standard feature set includes remote sensing, output trim, and remote on/off for convenient flexibility in distributed power applications.

QHW050A1-Q, QHW075A1-Q, and QHW100A1-Q Power Modules;
dc-dc Converters: 36 to 75 Vdc Input, 5 Vdc Output; 50 W to 100 W

Data Sheet
August 2006

Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Fusing Considerations

CAUTION: This power module is not internally fused. An input line fuse must always be used.

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of a sophisticated power architecture. To preserve maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a normal-blow fuse with a maximum rating of 20 A (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data for further information.

Solder, Cleaning, and Drying Considerations

Post solder cleaning is usually the final circuit-board assembly process prior to electrical testing. The result of inadequate circuit-board cleaning and drying can affect both the reliability of a power module and the testability of the finished circuit-board assembly. For guidance on appropriate soldering, cleaning, and drying procedures, refer to Tyco Electronics *Board-Mounted Power Modules Soldering and Cleaning* Application Note (AP97-021EPS). In addition follow below listed guidelines.

Cleaning & Application

Warning: If this module is processed through de-ionized cleaning process, we recommend that end user exercise listed precautions.

n **Application Assembly Cooling requirement after Solder Process:** Power modules and their associated application PWB assemblies should not be wash-cleaned after soldering until the power modules have had an opportunity to cool to within 10 ×C of the cleaning solution temperature. This will prevent vacuum absorption of the cleaning liquid into the module between the pins and the potting during cooling.

n **Washing Nozzle pressure:** Modules should be carefully washed with nozzle pressures less the 50 PSI.

Data Sheet
August 2006

QHW050A1-Q, QHW075A1-Q, and QHW100A1-Q Power Modules;
dc-dc Converters: 36 to 75 Vdc Input, 5 Vdc Output; 50 W to 100 W

Cleaning & Application Precautions (continued)

- **Drying:** It is recommended that after washing these modules be dried at 100 $\times$C for a minimum of 10 min and possibly more depending on use (see below).

- **Power Module PEM Stud use:**
  1) For module applications using the PEMs in any way, the drying time at 100 $\times$C should be increased to 30 minutes since liquid is more prone to enter any stress fractures induced between the PEMs and the potting compound during fastener insertion and tightening.
  2) The PEMs are specifically intended to enable mounting heat sinks onto the top surface of the module with fasteners inserted through the heat sink.
  3) It is recommended that threaded objects or other components not be inserted into the threaded PEMs from the under-surface side of these modules. Objects inserted at the underside can lead to cleaning solution entrapment in the fastener hole area and subsequent ingestion of the liquid into the module and failure. If such objects or attachments are used, then the drying method of 100 $\times$C for longer than 30 minutes may be required for adequate liquid purging.

- **PEM torque:** Maximum fastener/ PEM stud torque when attaching items from the heat sink mounting surface is 5.0 in lbs.; Maximum fastener/ PEM stud torque when attaching items from the potting surface is 2.5 in lbs.

Characteristic Curves

Data Sheet
August 2006

Design Considerations

Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. For the test configuration in Figure 17, a 33 μF electrolytic capacitor (ESR < 0.7 Ω at 100 kHz) mounted close to the power module helps ensure stability of the unit. For other highly inductive source impedances, consult the factory for further application guidelines.

Output Capacitance

High output current transient rate of change (high di/dt) loads may require high values of output capacitance to supply the instantaneous energy requirement to the load. To minimize the output voltage transient drop during this transient, low E.S.R. (equivalent series resistance) capacitors may be required, since a high E.S.R. will produce a correspondingly higher voltage drop during the current transient.

Output capacitance and load impedance interact with the power module's output voltage regulation control system and may produce an 'unstable' output condition for the required values of capacitance and E.S.R. may be dictated, depending on the modules control system.

Variations to a module's control system to accommodate larger values of capacitance are referred to by a '–T' suffix to the model number. There may be several different '–T' variations for a specific basic module.

The process of determining the acceptable values of capacitance and E.S.R. is complex and is load-dependant. Tyco provides Web-based tools to assist the power module end-user in appraising and adjusting the effect of various load conditions and output capacitances on specific power modules for various load conditions.

1. Access the web at **power.tycoelectronics.com/ power**

2. Under **Products**, click on the **DC-DC** link

3. Under **Design Tools**, click on **Stability Assessment**

4. Various design tools will be found under the appropriate code. Each of these tools has certain benefits to aid in the application of the power module to capacitive loads.

5. The **Excel download** file will allow calculation of phase and gain margin for specific values of load, including output capacitance, associated E.S.R., and interconnect impedance. _Be sure the Analysis tool-pak add-in is enabled in Excel_. Tutorials on acceptable gain and phase margin are also available using the appropriate links.

Safety Considerations

For safety-agency approval of the system in which the power module is used, the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standard, i.e., _UL_60950, _CSA_ C22.2 No. 60950-00, and _VDE_ 0805 (EN60950).

If the input source is non-SELV (ELV or a hazardous voltage greater than 60 Vdc and less than or equal to 75 Vdc), for the module's output to be considered meeting the requirements of safety extra-low voltage (SELV), all of the following must be true:

- The input source is to be provided with reinforced insulation from any hazardous voltages, including the ac mains.

- One V_I pin and one V_O pin are to be grounded, or both the input and output pins are to be kept floating.

- The input pins of the module are not operator accessible.

- Another SELV reliability test is conducted on the whole system, as required by the safety agencies, on the combination of supply source and the subject module to verify that under a single fault, hazardous voltages do not appear at the module's output.

Note: Do not ground either of the input pins of the module without grounding one of the output pins. This may allows a non-SELV voltage to appear between the output pin and ground.

The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

The input to these units is to be provided with a maximum 20 A normal-blow fuse in the ungrounded lead.

Tyco Electronics Corp.

Data Sheet
August 2006

QHW050A1-Q, QHW075A1-Q, and QHW100A1-Q Power Modules;
dc-dc Converters: 36 to 75 Vdc Input, 5 Vdc Output; 50 W to 100 W

Feature Descriptions

Overcurrent Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting for up to one second. If overcurrent exists for more than one second, the unit will shut down.

At the point of current-limit inception, the unit shifts from voltage control to current control. If the output voltage is pulled very low during a severe fault, the current-limit circuit can exhibit either foldback or tailout characteristics (output current decrease or increase).

The module is available in two overcurrent configurations. In one configuration, when the unit shuts down it will latch off. The overcurrent latch is reset by either cycling the input power or by toggling the ON/OFF pin for one second. In the other configuration, the unit will try to restart after shutdown. If the output overload condition still exists when the unit restarts, it will shut down again. This operation will continue indefinitely until the overcurrent condition is corrected.

Remote On/Off

Negative logic remote on/off turns the module off during a logic high and on during a logic low. To turn the power module on and off, the user must supply a switch to control the voltage between the on/off terminal and the $V_I(-)$ terminal ($V_{on/off}$). The switch can be an open collector or equivalent (see Figure 20). A logic low is $V_{on/off} = 0$ V to 1.2 V. The maximum $I_{on/off}$ during a logic low is 1 mA. The switch should maintain a logic-low voltage while sinking 1 mA.

During a logic high, the maximum $V_{on/off}$ generated by the power module is 15 V. The maximum allowable leakage current of the switch at $V_{on/off} = 15$ V is 50 μA.

If not using the remote on/off feature, short the ON/OFF pin to $V_I(-)$.
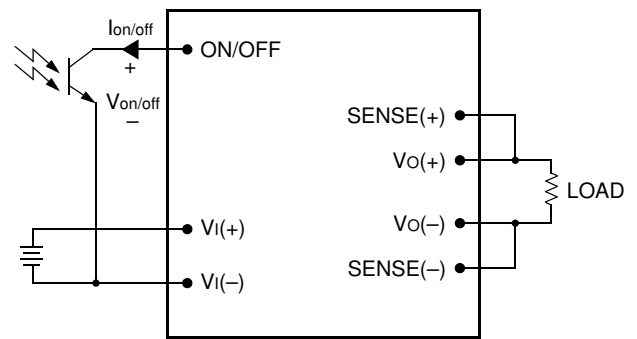

8-720 (F).c

Figure 20. Remote On/Off Implementation

Remote Sense

Remote sense minimizes the effects of distribution losses by regulating the voltage at the remote-sense connections. The voltage between the remote-sense pins and the output terminals must not exceed the output voltage sense range given in the Feature Specifications table, i.e.:

$$[V_O(+) - V_O(-)] - [SENSE(+) - SENSE(-)] \leq 0.5 \text{ V}$$

The voltage between the $V_O(+)$ and $V_O(-)$ terminals must not exceed the minimum output overvoltage protection value shown in the Feature Specifications table. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment (trim). See Figure 21.

If not using the remote-sense feature to regulate the output at the point of load, then connect SENSE(+) to $V_O(+)$ and SENSE(-) to $V_O(-)$ at the module.

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim. Consult the factory if you need to increase the output voltage more than the above limitation.

The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power.

Figure 21. Effective Circuit Configuration for Single-Module Remote-Sense Operation

Output Voltage Set-Point Adjustment (Trim)

Output voltage trim allows the user to increase or decrease the output voltage set point of a module. This is accomplished by connecting an external resistor between the TRIM pin and either the SENSE(+) or SENSE(−) pins. The trim resistor should be positioned close to the module.

If not using the trim feature, leave the TRIM pin open.

With an external resistor between the TRIM and SENSE(−) pins ($R_{adj-down}$), the output voltage set point ($V_{O, adj}$) decreases (see Figure 22). The following equation determines the required external-resistor value to obtain a percentage output voltage change of $\Delta\%$.

$$R_{adj-down} = \left(\frac{510}{\Delta\%} - 10.2\right) \ k\Omega$$

With an external resistor connected between the TRIM and SENSE(+) pins (R_{adj-up}), the output voltage set point ($V_{O, adj}$) increases (see Figure 23).

The following equation determines the required external-resistor value to obtain a percentage output voltage change of $\Delta\%$.

$$R_{adj-up} = \left(\frac{5.1 V_O(100 + \Delta\%)}{1.225\Delta\%} - \frac{510}{\Delta\%} - 10.2\right) \ k\Omega$$

The voltage between the $V_O(+)$ and $V_O(−)$ terminals must not exceed the minimum output overvoltage protection value shown in the Feature Specifications table. This limit includes any increase in voltage due to remote-sense compensation and output voltage set-point adjustment (trim). See Figure 21.

Although the output voltage can be increased by both the remote sense and by the trim, the maximum increase for the output voltage is not the sum of both. The maximum increase is the larger of either the remote sense or the trim. Consult the factory if you need to increase the output voltage more than the above limitation.

The amount of power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. When using remote sense and trim, the output voltage of the module can be increased, which at the same output current would increase the power output of the module. Care should be taken to ensure that the maximum output power of the module remains at or below the maximum rated power.

8-748 (F).b

Figure 22. Circuit Configuration to Decrease Output Voltage

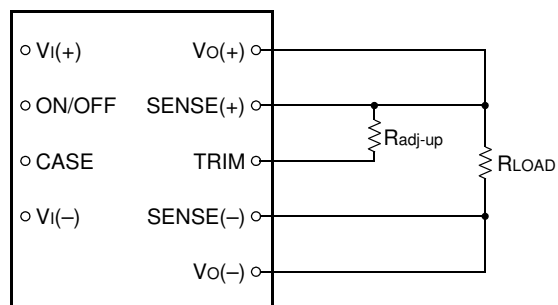

8-715 (F).b

Figure 23. Circuit Configuration to Increase Output Voltage

Note: The output voltage of this module may be increased by a maximum of 0.5 V. The 0.5 V is the combination of both the remote-sense and the output voltage set-point adjustment (trim). Do not exceed 5.5 V between the $V_O(+)$ and $V_O(−)$ terminals.

Feature Descriptions (continued)

Output Overvoltage Protection

The output overvoltage protection consists of circuitry that monitors the voltage on the output terminals. If the voltage on the output terminals exceeds the overvoltage protection threshold, then the module will shut down and latch off. The overvoltage latch is reset by either cycling the input power for one second or by toggling the on/off signal for one second. If the auto-restart option is chosen, the unit will "hiccup" until the temperature is within specification.

Overtemperature Protection

These modules feature an overtemperature protection circuit to safeguard against thermal damage. The circuit shuts down and latches off the module when the maximum case temperature is exceeded. The module can be restarted by cycling the dc input power for at least one second or by toggling the remote on/off signal for at least one second. If the auto-restart option is chosen, the unit will "hiccup" until the temperature is within specification.

Thermal Considerations

Introduction

The power modules operate in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat-dissipating components inside the unit are thermally coupled to the case. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the case temperature. Peak temperature (T_C) occurs at the position indicated in Figure 24.
Note: Top view, pin locations are for reference only.
       Measurements shown in millimeters and (inches).

Figure 24. Case Temperature Measurement Location

The temperature at this location should not exceed 100 °C. The output power of the module should not exceed the rated power for the module as listed in the Ordering Information table.

Although the maximum case temperature of the power modules is 100 °C, you can limit this temperature to a lower value for extremely high reliability.

Heat Transfer Without Heat Sinks

Increasing airflow over the module enhances the heat transfer via convection. Figures 25 and 26 show the maximum power that can be dissipated by the module without exceeding the maximum case temperature versus local ambient temperature (T_A) for natural convection through 3 m/s (600 ft./min.).

Note that the natural convection condition was measured at 0.05 m/s to 0.1 m/s (10 ft./min. to 20 ft./min.); however, systems in which these power modules may be used typically generate natural convection airflow rates of 0.3 m/s (60 ft./min.) due to other heat dissipating components in the system. The use of Figure 25 is shown in the following example.

Example

What is the minimum airflow necessary for a QHW075A1-Q operating at V_I = 48 V, an output current of 15 A, transverse orientation, and a maximum ambient temperature of 40 °C?

Solution

Given: V_I = 48 V
         I_O = 15 A
 T_A = 40 °C

Determine P_D (Use Figure 28.):
         P_D = 10.25 W

Determine airflow (v) (Use Figure 25.):
         v = 1.0 m/s (200 ft./min.)

Heat Transfer with Heat Sinks

The power modules have through-threaded, M3 x 0.5 mounting holes, which enable heat sinks or cold plates to attach to the module. The mounting torque must not exceed 0.56 N-m (5 in.-lbs.). For a screw attachment from the pin side, the recommended hole size on the customer's PWB around the mounting holes is 0.130 ± 0.005 inches. If a larger hole is used, the mounting torque from the pin side must not exceed 0.25 N-m (2.2 in.-lbs.).

Thermal derating with heat sinks is expressed by using the overall thermal resistance of the module. Total module thermal resistance (θca) is defined as the maximum case temperature rise ($\Delta T_{C, max}$) divided by the module power dissipation (P_D):

$$\theta ca = \left[\frac{\Delta T_{C, max}}{P_D}\right] = \left[\frac{(T_C - T_A)}{P_D}\right]$$

The location to measure case temperature (T_C) is shown in Figure 24. Case-to-ambient thermal resistance vs. airflow is shown, for various heat sink configurations, heights, and orientations, as shown in Figures 30 and 31. Longitudinal orientation is defined as when the long axis of the module is parallel to the airflow direction, whereas in the transverse orientation, the long axis is perpendicular to the airflow. These curves were obtained by experimental testing of heat sinks, which are offered in the product catalog.

These measured resistances are from heat transfer from the sides and bottom of the module as well as the top side with the attached heat sink; therefore, the case-to-ambient thermal resistances shown are generally lower than the resistance of the heat sink by itself. The module used to collect the data in Figures 30 and 31 had a thermal-conductive dry pad between the case and the heat sink to minimize contact resistance. The use of Figure 30 is shown in the following example.

Data Sheet
August 2006

QHW050A1-Q, QHW075A1-Q, and QHW100A1-Q Power Modules;
dc-dc Converters: 36 to 75 Vdc Input, 5 Vdc Output; 50 W to 100 W

Thermal Considerations (continued)

Heat Transfer with Heat Sinks (continued)

Example

If an 85 °C case temperature is desired, what is the minimum airflow necessary? Assume the QHW075A1-Q module is operating at V_I = 48 V and an output current of 15 A, maximum ambient air temperature of 40 °C, and the heat sink is 1/2 inch. The module is oriented in the transverse direction.

Solution

Given: V_I = 48 V
I_O = 15 A
T_A = 40 °C
T_C = 85 °C
Heat sink = 1/2 inch

Determine P_D by using Figure 28:

P_D = 10.25 W

Then solve the following equation:

$$\theta ca = \left[\frac{(T_C - T_A)}{P_D}\right]$$

$$\theta ca = \left[\frac{(85 - 40)}{10.25}\right]$$

$$\theta ca = 4.39 \text{ °C/W}$$

Use Figure 30 to determine air velocity for the 1/2 inch heat sink.

The minimum airflow necessary for this module is 0.6 m/s (120 ft./min.).

Custom Heat Sinks

A more detailed model can be used to determine the required thermal resistance of a heat sink to provide necessary cooling. The total module resistance can be separated into a resistance from case-to-sink (θcs) and sink-to-ambient (θsa) as shown in Figure 36.
8-1304 (F).e

Figure 36. Resistance from Case-to-Sink and Sink-to-Ambient

For a managed interface using thermal grease or foils, a value of θcs = 0.1 °C/W to 0.3 °C/W is typical. The solution for heat sink resistance is:

$$\theta sa = \left[\frac{(T_C - T_A)}{P_D}\right] - \theta cs$$

This equation assumes that all dissipated power must be shed by the heat sink. Depending on the user-defined application environment, a more accurate model, including heat transfer from the sides and bottom of the module, can be used. This equation provides a conservative estimate for such instances.

EMC Considerations

For assistance with designing for EMC compliance, please refer to the *FLTR100V10 Filter Module* Data Sheet (DS99-294EPS).

Layout Considerations

Copper paths must not be routed beneath the power module mounting inserts. For additional layout guidelines, refer to the *FLTR100V10 Filter Module* Data Sheet (DS99-294EPS).

Post Solder Cleaning and Drying Consideratrions

Post solder cleaning is usually the final circuit-board assembly process prior to electrical board testing.The result of inadequate cleaning and drying can affect both the reliability of a power module and the testability of the finished circuit-board assembly.For guidance on appropriate soldering,cleaning and drying procedures,refer to Tyco Electonics Board Mounted Power Modules:*Soldering and Cleaning* Application Note.

Through-Hole Lead Free Soldering Information

The RoHS-compliant through-Hole products use the SAC(Sn/Ag/Cu) Pb-free solder and RoHS- compliant components.They are designed to be processed through single or dual wave soldering machines.The pins have an RoHS-compliant finish that is compatible with both Pb and Pb-free wave soldering processes.A Maximum preheat rate 3^0C/s is suggested.The wave preheat process should be such that the temperature of the power module board is kept below 210^0C.For Pb solder,the recommended pot temperature is 260^0C,while the Pb-free solder pot is 270^0C max.Not all RoHS-compliant through-hole products can be processed with paste-through-hole Pb or Pb-free reflow process.If additional information is needed,please consult with your Tyco Electronics Power System representative for more details.
