

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

**Features**

- 30dB RF Gain Control
- 40dB IF Gain Control
- 5dB Max. Noise Figure SSB
- LNA Input Internally Matched to 75Ω
- Single 5V Supply

**Applications**

- Cable Set Top Box
- General Purpose Downconverter
- Commercial and Consumer Systems

Functional Block Diagram

**Product Description**

The RF3334 is an IF LNA/Mixer suitable for downconversion of forward channel control data in a set-top box application. It consists of a single-ended 75Ω terminated LNA, followed by a differential gain control stage with 30dB of analog gain control and a double-balanced mixer. The mixer load is available via pins 10 and 11 should an external filter be required. The mixer output is connected to an IF amplifier that can be configured from 10dB to 40dB gain with an external resistor. The amplifier is capable of 6V pk-pk output into a 1kΩ load.

**Ordering Information**

RF3334	LNA Mixer
RF3334PCBA-41X	Fully Assembled Evaluation Board

**Optimum Technology Matching® Applied**

## Absolute Maximum Ratings

Parameter	Rating	Unit
Supply Voltage	-0.5 to 7.0	V <sub>DC</sub>
IF Input Level	500	mV <sub>pp</sub>
Operating Ambient Temperature	-40 to +85	°C
Storage Temperature	-40 to +150	°C

**Caution!** ESD sensitive device.

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

RoHS status based on EU Directive 2002/95/EC (at time of this document revision).

The information in this publication is believed to be accurate and reliable. However, no responsibility is assumed by RF Micro Devices, Inc. ("RFMD") for its use, nor for any infringement of patents, or other rights of third parties, resulting from its use. No license is granted by implication or otherwise under any patent or patent rights of RFMD. <b>Thermal</b>					
Theta <sub>JC</sub>		65		$^{\circ}$ C/W	V <sub>CC</sub> = 5.25V, V <sub>RFAGC</sub> = 4.5V, I <sub>CC</sub> = 29mA, P <sub>DISS</sub> = 154mW
Maximum Measured Junction Temperature at DC Bias Conditions		95		$^{\circ}$ C	T <sub>AMB</sub> = +85 $^{\circ}$ C

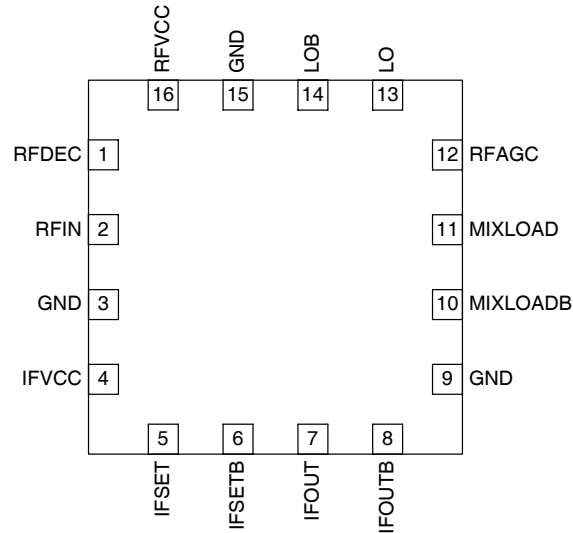

Pin	Function	Description	Interface Schematic
1	RFDEC	External decoupling capacitor for RF single-ended to differential converter.	
2	RF	LNA Input, Internally matched to 75Ω. Should be AC-coupled.	
3	GND	Ground.	
4	IFVCC	5V supply for IF section.	
5	IFSET	IF Gain select. The resistance between this pin and pin 6 (IFSETB) determines the gain of the IF amplifier. Maximum gain is achieved by placing a short circuit between the pins. Larger values of resistance will reduce the IF gain according to the following equation where R is the value of resistance between pins 5 and 6. $IFGain = 20 \log(1600 / (R = 75)) 15$ .	
6	IFSETB	Complementary IF Gain select.	
7	IFOUT	IF Amplifier Output. Differential output of the IF amplifier. The differential load across this pin and pin 8 (IFOUTB) should be 1kΩ or greater for optimal performance. The differential output impedance across this pin and pin 8 is 10Ω.	
8	IFOUTB	Complementary IF Amplifier Output.	
9	GND	Ground.	
10	MIXLOADB	Complementary Mixer load.	
11	MIXLOAD	Differential output of the RF mixer. A resonant load should be applied to this pin and pin 10 (MIXLOADB) that will act as a bandpass filter at the desired IF frequency. Vcc should be supplied to this pin via an inductor or a resistor. Use of a resistor will degrade intermodulation performance.	

Pin	Function	Description	Interface Schematic
12	<b>RFAGC</b>	RF Gain select voltage input. The voltage applied to this pin sets the gain of the RF amplifier. The voltage applied to this pin should be between 0.5V and 4.5V. The RF gain characteristic is such that 0.5V yields a gain of -2dB and 4.5V yields a gain of +30dB as measured from the input of the LNA to the output of the mixer stage.	
13	<b>LO</b>	Differential LO Input. This pin and pin 14 (LOB) are the differential LO inputs. This input should be AC-coupled. The differential input impedance across pins 13 and 14 is 75Ω. The LO may be driven single ended but will require a higher drive level. If a single ended LO is applied, pin 14 should be AC-coupled to ground.	
14	<b>LOB</b>	Complementary LO Input. Should be AC-coupled.	
15	<b>GND</b>	Ground.	
16	<b>RFVCC</b>	5V supply for RF section.	
<b>GND</b>	<b>Paddle</b>	Backside of package should be connected to ground.

## Pin-Out

## Application Schematic

Evaluation Board Schematic

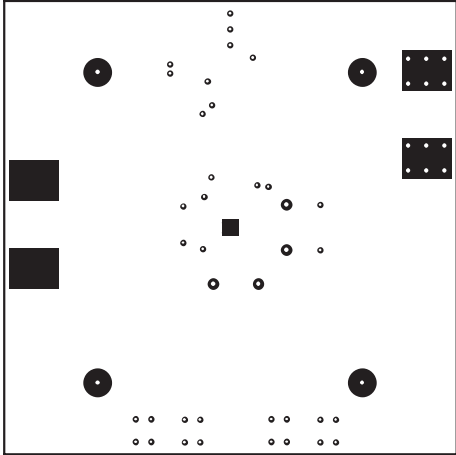

## Evaluation Board Layout

Board Size 2.0" x 2.0"

Board Thickness 0.032", Board Material FR-4, Multi-layer

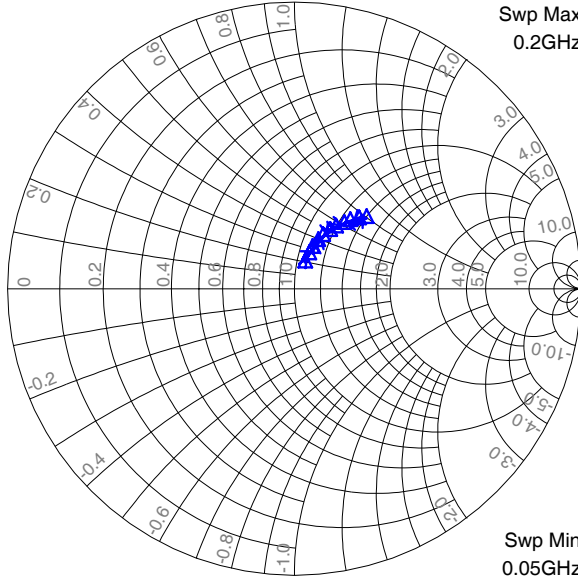

RF Input, Temp = +25°C

LO Input, Temp = +25°C

## PCB Design Requirements

### PCB Surface Finish

The PCB surface finish used for RFMD's qualification process is electroless nickel, immersion gold. Typical thickness is 3µinch to 8µinch gold over 180µinch nickel.

### PCB Land Pattern Recommendation

PCB land patterns are based on IPC-SM-782 standards when possible. The pad pattern shown has been developed and tested for optimized assembly at RFMD; however, it may require some modifications to address company specific assembly processes. The PCB land pattern has been developed to accommodate lead and package tolerances.

### PCB Metal Land Pattern

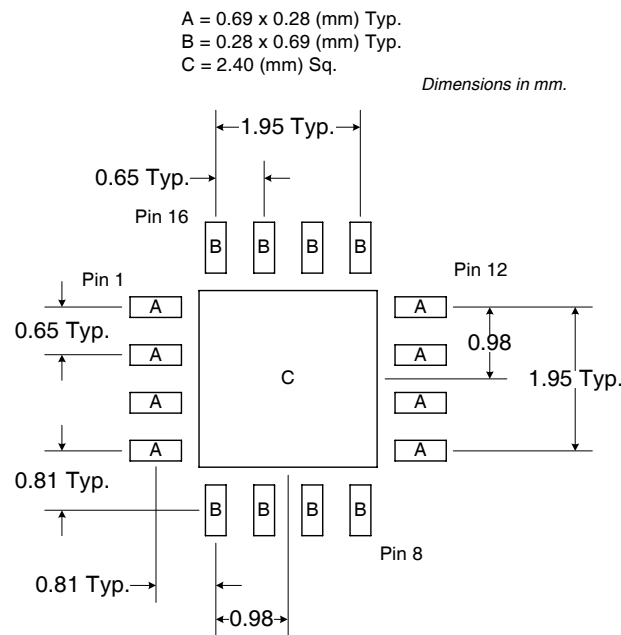

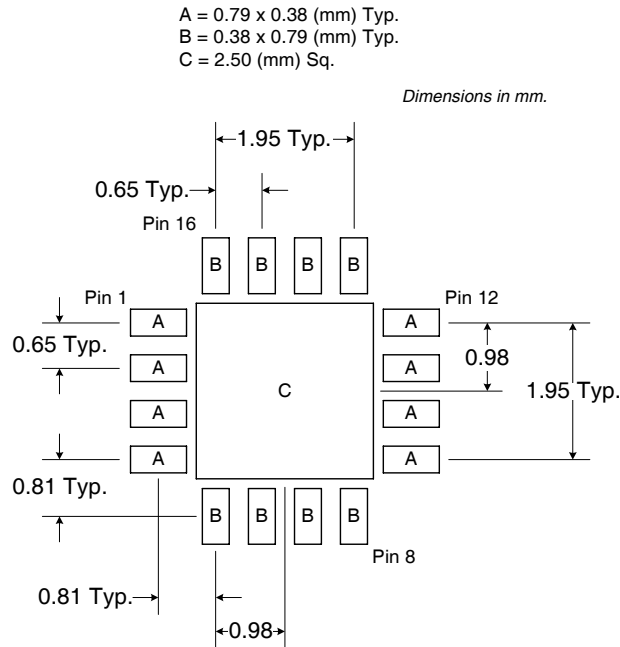

Figure 1. PCB Metal Land Pattern (Top View)

## PCB Solder Mask Pattern

Liquid Photo-Imageable (LPI) solder mask is recommended. The solder mask footprint will match what is shown for the PCB metal land pattern with a 2mil to 3mil expansion to accommodate solder mask registration clearance around all pads. The center-grounding pad shall also have a solder mask clearance. Expansion of the pads to create solder mask clearance can be provided in the master data or requested from the PCB fabrication supplier.

**Figure 2. PCB Solder Mask Pattern (Top View)**

## Thermal Pad and Via Design

The PCB land pattern has been designed with a thermal pad that matches the die paddle size on the bottom of the device.

Thermal vias are required in the PCB layout to effectively conduct heat away from the package. The via pattern has been designed to address thermal, power dissipation and electrical requirements of the device as well as accommodating routing strategies.

The via pattern used for the RFMD qualification is based on thru-hole vias with 0.203mm to 0.330mm finished hole size on a 0.5mm to 1.2mm grid pattern with 0.025mm plating on via walls. If micro vias are used in a design, it is suggested that the quantity of vias be increased by a 4:1 ratio to achieve similar results.
