

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# **RSGD**

### Three phase AC motor soft starter

### Description

RSGD is an extremely compact and easy to use 3-phase soft starter for AC induction motors rated up to 100Arms.

The starting parameters can be easily set-up through 3 knobs.

The integrated motor overload protection (Class 10) and Modbus communication\*\* result in a higher installation flexibility.

### Benefits

- Easy to use. The RSGD is equipped with a self-learning algorithm that automatically adjusts the start parameters to optimise the motor starts and stops.
- Fast installation and set-up. Only 3 settings are required (FLC, ramp-up and ramp-down).
- Compact dimensions. 12 45Arms in 45mm wide housing, 55 100Arms in 75mm wide housing.
- Integrated protection. Diagnostic functions provide additional protection. RSGD is also equipped with an overload protection (Class 10)\*.
- Torque control during ramp-down. Smoother deceleration of the load.
- Complete monitoring. The RSGD is equipped with a Modbus/RTU communication port by 2-wire RS485 connection\*\*.
- Guided model selection. Easy to use selection tool to select the appropriate soft starter model depending on the application type.

# **>** A

### **Applications**

RSGD soft starters are the ideal solution for 3-phase fixed speed AC induction motor applications where there is the need to reduce the starting current and/or minimise stresses on the motor during start and stop.

The RSGD offers a number of integrated diagnostic functions that can replace additional components inside the electrical panel.

Typical applications include: compressors, pumps and fans.

### **Main functions**

- Soft starting and soft stopping of AC motors.
- Integrated electronic overload protection (Class 10)\*.
- · Serial communication (Modbus) over RS485\*\*.
- \* RSGD VD210, VX210, VX310C, VX311C models only
- \*\* RSGD 75mm models only

- Contact Carlo Gavazzi representative for further information.
- Option "GG": 100 240 VAC or option "FF": 24 VAC/DC.

Note: Option FF available only for RSGD 75mm models

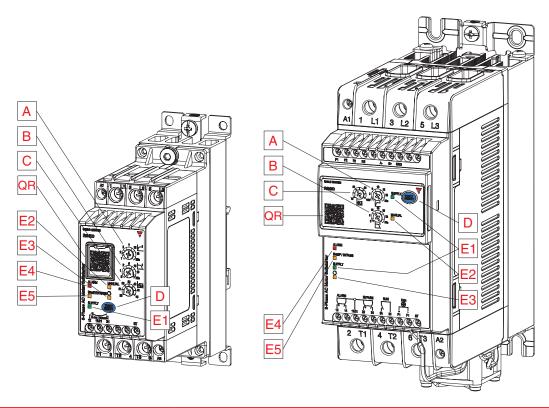

Caution: the actual motor amps may be higher or lower than the average values listed above. We suggest to use the actual motor current as listed on the motor nameplate. Use this table as a guide only.

### **CARLO GAVAZZI compatible components**

| Purpose               | Component name/code | Notes  |
|-----------------------|---------------------|--|
| Manual motor starters | GMS-32              | S: standard H: high breaking capacity                                  |
| Finger guards         | RFCG X6             | 6 pcs per box  |
| Cooling fan           | RFAN-75-40 12 X1    | For RSGD100 only<br>Rated voltage : 12 VDC<br>Power consumption: 0.6 W |

# **Structure**

| Element | Component               | Function   |
|---------|-------------------------|--|
| Α       | Ramp-up time selector   | Sets the desired motor starting time.  |
| В       | Ramp-down time selector | Sets the desired motor stopping time.  |
| С       | FLC knob selector       | Sets the motor full load current (FLC). The FLC is setting is used by the RSGD for the overload protection and for the maximum current allowed during motor start.   |
| D       | Test/Reset              | Simulate overload alarm (press for 1 sec when RSGD is in Idle state) Set alarm recovery mode (press for 5 sec when RSGD is in Idle state) Reset alarms (press for <1sec when RSGD is in alarm mode and alarm mode is Manual) Enable/disable phase sequence protection (press for 10sec when RSGD is in Idle state) |
| E1      | LED indicators          | Supply. Indicates that the RSGD supply is ON.  |
| E2      | LED indicators          | Manual. Indicates the alarm reset mode.  Manual reset mode - LED ON, Auto reset mode - LED OFF  (Factory default setting: Auto, LED OFF)   |
| E3      | LED indicators          | Phase sequence. Indicates if the wrong phase sequence protection is enabled (LED OFF) or disabled (LED ON). (Factory default setting: Enabled, LED OFF)  |
| E4      | LED indicators          | Alarm. Indicates that the RSGD is in alarm. The number of flashes indicates the alarm type.  |
| E5      | LED indicators          | Ramping/bypass. Indicates whether RSGD is in ramping (flashing) or bypass (fully ON).  |
| QR      | QR code                 | Scan to link to troubleshooting guide.   |

# **Mode of operation**

The RSGD series of soft starters works on two distinct self-learning algorithms depending on the ramp-up time settings.

| Ramp-up        | Mode of operation   |
|----------------|---|
| 1 or 2 seconds | <ul> <li>When the ramp-up knob is in position 1 or 2, the RSGD will follow a self learning current limit algorithm.</li> <li>As soon as A1-A2 (or ST for RSGD60 models) control voltage signal is applied, the RSGD will start to ramp-up the motor.</li> <li>At the very first start the current limit will be 4 x FLC setting.</li> <li>In the subsequent starts, the RSGD will automatically adjust the current limit setting to maintain the motor start time as close as possible to the ramp-up time setting.</li> </ul>  |
| ≥ 5 seconds    | <ul> <li>When the ramp-up knob is in position 5 or above, the RSGD will follow a self-learning current ramp algorithm.</li> <li>The RSGD will start with a set of default parameters for starting torque.</li> <li>Depending on the ramp-up time setting, the RSGD will apply a current ramp algorithm to start the motor as close as possible to the set ramp-up time.</li> <li>During the motor start, the current will be limited to a maximum of 3.5 x FLC setting.</li> <li>In the subsequent starts, the RSGD will continue to adjust the starting parameters of initial torque and current ramp to ensure that the motor is started as close as possible to the set ramp-up time.</li> </ul> |

| Ramp-down       | Mode of operation  |
|-----------------|--|
| 1 to 30 seconds | <ul> <li>During ramp-down, the RSGD works on a torque control algorithm for smoother stopping of the motor.</li> <li>As soon as the control voltage signal A1-A2 (or ST for RSGD 60 models) is removed, the RSGD will slow down the motor gradually according to the ramp-down setting.</li> <li>The power semiconductors will be switched OFF as soon as the time (as per ramp-down setting) has elapsed unless there is a risk of exceeding the maximum temperature on the semiconductors. In such a case the RSGD will leave the motor to coast to stop.</li> </ul> |
| 0 seconds       | <ul> <li>If the ramp-down knob is set to 0, the RSGD will leave the motor to coast to stop (no ramp-down).</li> </ul>  |

Note 1: for the Canadian application, the control terminals A1, A2 (or A1, A2, ST for RSGD60 versions) of the RSGD devices shall be supplied by a secondary circuit where power is limited by a transformer, rectifier, voltage divider, or similar device that derives power from a primary circuit, and where the short-circuit limit between conductors of the secondary circuit or between conductors and ground is 1500VA or less. The shortcircuit volt ampere limit is the product of the open circuit voltage and the short circuit ampere.

Note 2: RSGD60 soft starters require a separate 100 - 240V, 50/60Hz single phase control source. Output connections (L1, L2, L3, T1, T2, T3) are not galvanically isolated from the external supply connections (A1, A2, ST).

Note: the overload cycle describes the switching capability of the soft starter at a surrounding temperature of 40°C as described in EN/IEC 60947-4-2. An overload cycle AC53b:3-12:348 means that the soft starter can handle a starting current of 3x le for 12 seconds followed by an OFF time of 348 seconds.

<sup>\*</sup> For RSGD6045 models, operational current is 45 Arms @ 25°C.

### **Alarms**

The RSGD includes a number of diagnostics and protection features each of which is signalled through a flashing sequence on the red LED.

| Number of flashes                 | 2   |
|-----------------------------------|---|
| Alarm                             | Wrong phase sequence  |
| Aldilli                           |   |
| Alarm description                 | If the connection to the soft starter is not done in the correct sequence (L1, L2, L3), the RSGD will trigger the wrong phase sequence alarm and the motor will not be started.   |
| Alarm recovery period             | N/A   |
| Consecutive alarms for hard reset | 1   |
| Action to recover alarm           | User intervention is required to change the wiring sequence to recover alarm. Note: the phase sequence monitoring can be disabled. To disable the alarm, press the Test/Reset button for 10 seconds when the RSGD is in IDLE state. The yellow LED will turn ON.  ATTENTION: in this mode, if the wiring is not in the correct sequence, the motor will rotate in the reverse direction.  • Check that wiring on L1, L2, L3 is in the correct sequence.  • If you need to reverse the motor, make sure that the phase sequence LED                                |
| Troubleshooting                   | is ON (phase sequence protection disabled).   |
| Number of flashes                 | 3   |
| Alarm                             | Line voltage out of range   |
| Alarm description                 | At every power-up the RSGD automatically detects the supply voltage level and determines whether it is working on a 220, 400, 480* or 600* V supply. The under- or over- voltage alarm level is then set at a level of -20% and + 20% (from the measured supply voltage level) respectively. If the supply voltage level is out of these limits for more than 5 seconds then the line voltage out of range alarm will be triggered.  * Applies to RSGD60 models.  Note: for RSGD60 over-voltage alarm level (for the case of a 600V supply) is 675V (600V + 11%). |
| Alarm recovery period             | 5 minutes (If manual reset mode is applied, alarm can be reset by pressing the Test/Reset button).  |
| Consecutive alarms for hard reset | 4   |
| Action to recover alarm           | The alarm will self-recover (in auto-recovery mode) after 5 minutes from when the supply voltage is within limits.  |
| Troubleshooting                   | <ul> <li>Check supply voltage level across L1, L2, L3 terminals.</li> <li>Make sure that you are not using a RSGD40 model on a supply voltage &gt; 440 VAC.</li> </ul>  |
| Number of flashes                 | 4   |
| Alarm                             | Phase loss (motor side)   |
| Alarm description                 | If any of the phases on the load (motor) side becomes open the RSGD will trip after 5 seconds to protect the motor from running/ starting on 2 phases. Note: this alarm will also be triggered when a current unbalance of > 20% is detected on any of the three line currents for a minimum of 5 secs. Additionally if a SCR and/or bypass relay is open (damaged) the same alarm will be triggered.   |
| Alarm recovery period             | 5 minutes (If manual reset mode is applied, alarm can be reset by pressing the Test/Reset button).  |
| Consecutive alarms for hard reset | 4   |
| Action to recover alarm           | Check connections on the output side of the soft starter and on the motor terminals. The alarm will self-recover (in Auto-recovery mode) after 5 minutes.   |
| Troubleshooting                   | <ul> <li>Check for any loose connections on the T1, T2, T3 side of the soft starter.</li> <li>Check for any loose connections on the motor terminals.</li> <li>Check motor windings.</li> </ul>   |
