

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## 0.3A/0.6A, High/Low-Side MOSFET Driver

### General Description

The RT7021A/B is a high-voltage gate driver IC with dual outputs. The IC, together with an external bootstrap network, drives dual n-channel MOSFETs or IGBTs with input voltage rail up to 600V.

The IC is equipped with a “common-mode dV/dt noise canceling technique” to provide high dV/dt immunity which enables stable operation under high dV/dt noise circumstances. Two Under-Voltage Lockout (UVLO) functions continuously monitor the bias voltages on VCC and BOOT-to-LX for preventing malfunction when the bias voltages are lower than the specified threshold voltages. The logic level of the PWM signal input pins are compatible with standard TTL logic level for ease of interfacing with controlling devices.

### Applications

- PDP Scan Driver
- Fluorescent Lamp Ballast
- SMPS
- Motor Driver

### Features

- Floating Channels Designed for Bootstrap Operation with Input Voltage up to 600V
- 300mA/600mA Sourcing/Sinking Current
- High dV/dt Immunity :  $\pm 50V/nsec$
- VCC and VBOOT – LX Supply Range from 13V to 20V
- Under-Voltage Lockout Functions for Both Channels
- TTL Compatible Logic Input
- Matched Propagation Delay below 20ns
- Outputs in Phase with Input (RT7021A) or Out of Phase with Input (RT7021B)
- RoHS Compliant and Halogen Free

### Ordering Information

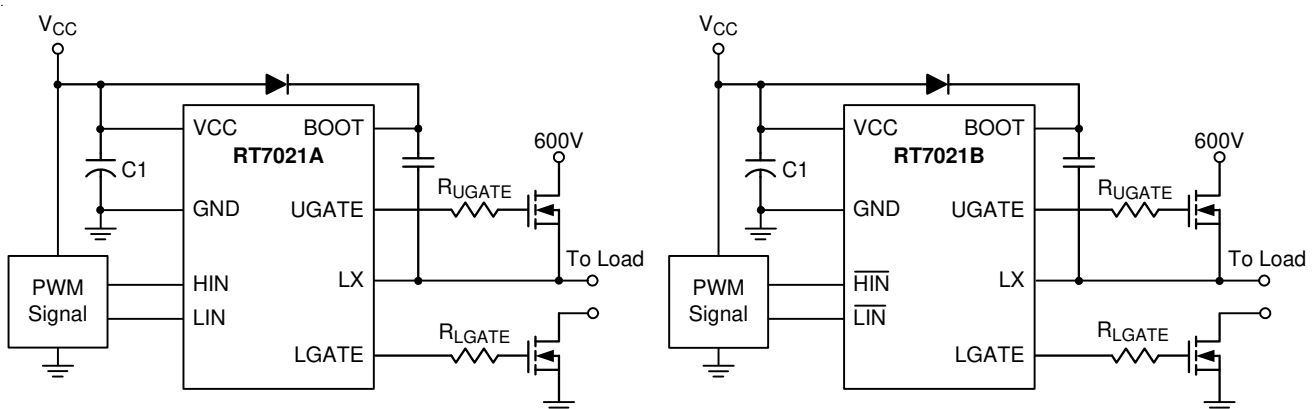

RT7021A/B	□ □
	Package Type
	S : SOP-8
	N : DIP-8
	Lead Plating System
	G : Green (Halogen Free and Pb Free)
	With Input
	A : In Phase
	B : Out of Phase

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

## Functional Pin Description

Pin No.		Pin Name	Pin Function
SOP-8	DIP-8		
1	1	VCC	Supply voltage input.
2	2	HIN (RT7021A)	Logic input for high-side gate driver.
		$\overline{\text{HIN}}$ (RT7021B)	Logic input for high-side gate driver.
3	3	LIN (RT7021A)	Logic input for low-side gate driver.
		$\overline{\text{LIN}}$ (RT7021B)	Logic input for low-side gate driver.
4	4	GND	Logic ground and low-side driver return.
5	5	LGATE	Low-side driver output.
6	6	LX	Return for high-side gate driver.
7	7	UGATE	High-side driver output.
8	8	BOOT	Bootstrap supply for high-side gate driver.

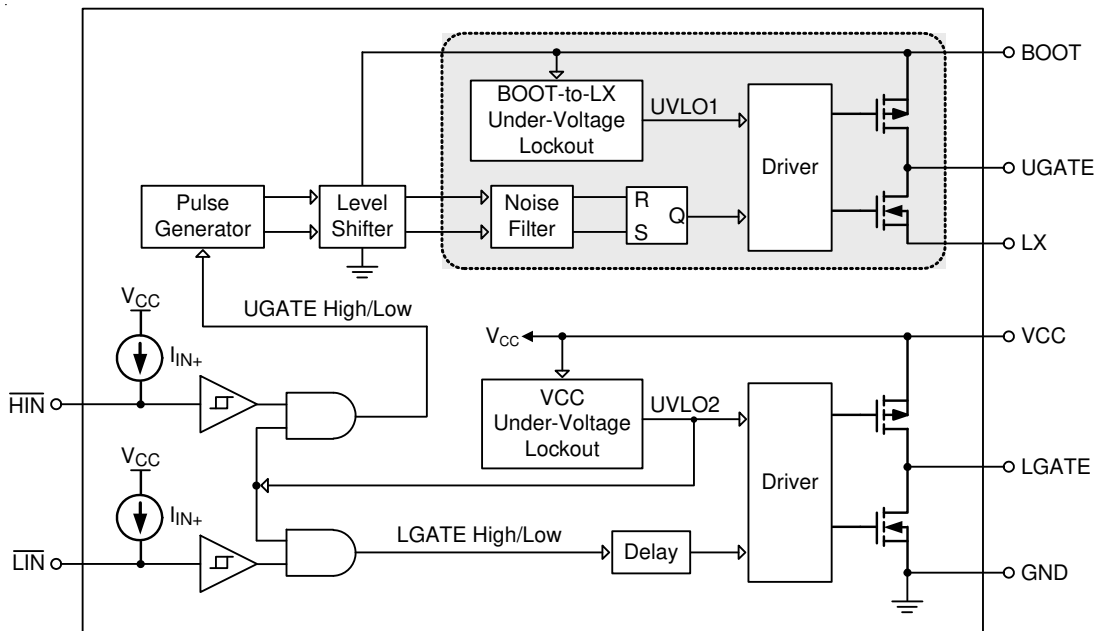

**Functional Block Diagram**

For RT7021A

For RT7021B

## Operation

The RT7021A/B is a high-voltage gate driver for driving high-side and low-side MOSFETs. The RT7021A/B uses ultra high voltage device and floating well to allowed UGATE to drive external MOSFET operating up to 600V. When the HIN voltage is above the logic-high threshold, the UGATE voltage goes high to turn on the external MOSFET. When the HIN voltage is below the logic-low threshold, the MOSFET is turned off. The operating behavior of the LGATE, controlled by the LIN pin, is like the behavior of the UGATE.

### **Under-Voltage Lockout (UVLO) Function**

When the VCC or BOOT-to-LX voltage is lower the UVLO threshold, the UGATE and LGATE output will be disabled.

### **Pulse Generator**

The pulse generator is used to transmit the HIN input signal to the UGATE driver.

**Absolute Maximum Ratings** (Note 1)

- VCC Supply Voltage,  $V_{CC}$  ----- -0.3V to 25V
- LX to GND ----- -0.3V to 625V
- BOOT to LX,  $V_{BOOT-LX}$  ----- -0.3V to 25V
- UGATE to LX ----- -0.3V to  $V_{BOOT-LX} + 0.3V$
- LGATE to GND ----- -0.3V to  $V_{CC} + 0.3V$
- HIN, LIN,  $\overline{HIN}$ ,  $\overline{LIN}$  to GND ----- -0.3V to  $V_{CC} + 0.3V$
- Allowable LX Voltage Slew Rate,  $dV_{LX}/dt$  ----- -50V/ns to 50V/ns
- Power Dissipation,  $P_D$  @  $T_A = 25^\circ C$ 
  - SOP-8 ----- 0.53W
  - DIP-8 ----- 0.74W
- Package Thermal Resistance (Note 2)
  - SOP-8,  $\theta_{JA}$  ----- 188°C/W
  - DIP-8,  $\theta_{JA}$  ----- 134.9°C/W
- Junction Temperature ----- 150°C
- Lead Temperature (Soldering, 10 sec.) ----- 260°C
- Storage Temperature Range ----- -65°C to 150°C

**Recommended Operating Conditions** (Note 3)

- VCC Supply Voltage,  $V_{CC}$  ----- 13V to 20V
- LX to GND ----- -5V to 600V
- BOOT-to-LX,  $V_{BOOT-LX}$  ----- 13V to 20V
- UGATE to LX ----- -5V to  $V_{BOOT-LX}$
- LGATE to GND ----- 0 to  $V_{CC}$
- HIN, LIN,  $\overline{HIN}$ ,  $\overline{LIN}$  to GND ----- 0 to  $V_{CC}$
- Ambient Temperature Range ----- -40°C to 125°C

**Electrical Characteristics**

( $V_{CC} = V_{BOOT-LX} = 15V$ ,  $T_A = 25^\circ C$ , unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
VCC Under-Voltage Lockout Threshold (On)	$V_{THON\_VCC}$		9	10.5	12	V
$V_{BOOT-LX}$ Under-Voltage Lockout Threshold (On)	$V_{THON\_BOOT}$		9	10.5	12	V
VCC Under-Voltage Lockout Threshold (Off)	$V_{THOFF\_VCC}$		8	9.5	11	V
$V_{BOOT-LX}$ Under-Voltage Lockout Threshold (Off)	$V_{THOFF\_BOOT}$		8	9.5	11	V
VCC Under-Voltage Lockout Hysteresis	$V_{HYS\_VCC}$		--	1	--	V

Parameter		Symbol	Test Conditions	Min	Typ	Max	Unit
V <sub>BOOT-LX</sub> Under-Voltage Lockout Hysteresis		V <sub>HSY_BOOT</sub>		--	1	--	V

	Logic-Low	I <sub>IN+</sub>	H <sub>IN</sub> = L <sub>IN</sub> = 0V (RT7021B)	--	2	10	
UGATE and LGATE Sourcing Current		I <sub>O+</sub>	UGATE = LX, LGATE = GND, Current pulse width < 10μs, Low duty	--	290	--	mA
UGATE and LGATE Sinking Current		I <sub>O-</sub>	UGATE = BOOT, LGATE = VCC, Current pulse width < 10μs, Low duty	--	600	--	mA

### Dynamic Electrical Characteristics (Note 4)

(V<sub>CC</sub> = V<sub>BOOT-LX</sub> = 15V, LX = GND, C<sub>L</sub> = 1000pF, T<sub>A</sub> = 25°C, unless otherwise specified)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Turn-on Delay	t <sub>ON</sub>		--	150	220	ns
Turn-off Delay	t <sub>OFF</sub>	V <sub>LX</sub> = 0 or 600V (Note 5)	--	150	220	ns
Turn-on Rising Time	t <sub>R</sub>		--	70	170	ns
Turn-off Falling Time	t <sub>F</sub>		--	35	90	ns
Delay Matching Time, HS and LS Turn-on/off	t <sub>M</sub>		--	--	20	ns

**Note 1.** Stresses beyond those listed “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

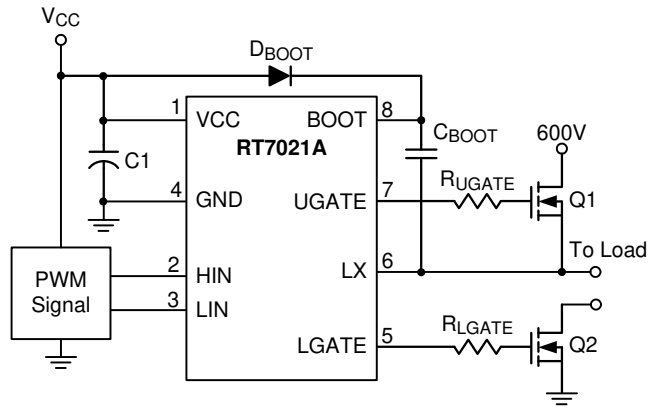

**Note 2.** θ<sub>JA</sub> is measured under natural convection (still air) at T<sub>A</sub> = 25°C with the component mounted on a high effective-thermal-conductivity four-layer test board on a JEDEC 51-7 thermal measurement standard.

**Note 3.** The device is not guaranteed to function outside its operating conditions.

**Note 4.** Please refer to the Timing Diagram and Dynamic Waveforms in the Application Information.

**Note 5.** Turn-off Delay for V<sub>LX</sub> = 600V is guaranteed by design.

Application Information

Timing Diagram and Dynamic Waveforms

Figure 1 is RT7021A/B input / output timing diagram, and Figure 2, Figure 3 are the definition of dynamic characteristics. You can know those definitions and the relationship between input and output from these figures. For example :  $t_{ON}$ ,  $t_{OFF}$ ,  $t_R$ ,  $t_F$ ,  $t_M$ ...

Figure 1. Input/Output Timing Diagram

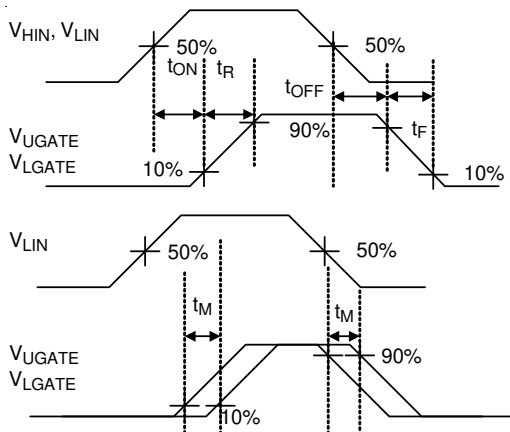

Figure 2. Dynamic Electrical Characteristics Definition for RT7021A

Figure 3. Dynamic Electrical Characteristics Definition for RT7021B

Matched Propagation Delays between Both Channels

Because the IC internal level shifter circuit causes the propagation delay of the high-side output signal, shown in Figure 4. The RT7021A/B adds a propagation delay matching circuit in the low-side logic circuit, so that high-side and low-side output signals approximately synchronization.

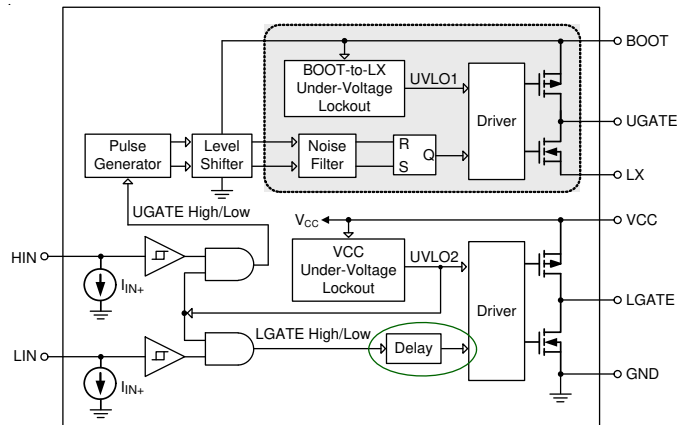

Figure 4. Propagation Delay Matching Circuit

Thermal Considerations

The junction temperature should never exceed the absolute maximum junction temperature  $T_{J(MAX)}$ , listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where  $T_{J(MAX)}$  is the maximum junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is 125°C. The junction-to-ambient thermal resistance,  $\theta_{JA}$ , is highly package dependent. For a SOP-8 package, the thermal resistance,  $\theta_{JA}$ , is 188°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity

four-layer test board. For a DIP-8 package, the thermal resistance,  $\theta_{JA}$ , is 134.9°C/W on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated as below :

$$P_{D(\text{MAX})} = (125^\circ\text{C} - 25^\circ\text{C}) / (188^\circ\text{C/W}) = 0.53\text{W for a SOP-8 package.}$$

$$P_{D(\text{MAX})} = (125^\circ\text{C} - 25^\circ\text{C}) / (134.9^\circ\text{C/W}) = 0.74\text{W for a DIP-8 package.}$$

The maximum power dissipation depends on the operating ambient temperature for the fixed  $T_{J(\text{MAX})}$  and the thermal resistance,  $\theta_{JA}$ . The derating curves in Figure 5 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

Figure 5. Derating Curve of Maximum Power Dissipation

### Layout Consideration

A proper PCB layout for power supply can reduce unnecessary waveform noise and electromagnetic interference problems to ensure proper system operation, please refer to the following PCB layout considerations :

- ▶ For the high voltage and high current loop layout of power supply should be as thick and short. Avoid excessive layout generated parasitic inductance and resistors to cause significant noise.
- ▶ In order to shorten the length of IC layout, you need to consider the relative placement for IC and the power switches. It is recommended that the power switches placed in a symmetrical manner, and the IC close to high-side and low-side elements.

- ▶ In order to reduce the noise coupling, it is recommended that the ground layout should not be placed under or near the high voltage floating side.
- ▶ The layout between high-side and low-side power switches should be thick and straight, avoiding the formation of long loops. Too long distance will increase the loop area, and electromagnetic interference suppression capabilities would be affected. However, too short distance may cause overheating situation. It is necessary to consider the most appropriate way.
- ▶ Refer to typical application circuit, the VCC capacitor (C1), BOOT to LX capacitor ( $C_{\text{BOOT}}$ ), and bootstrap diode ( $D_{\text{BOOT}}$ ) need to be placed as close to the IC as possible to minimize parasitic inductance and resistance. The  $C_{\text{BOOT}}$  selected range is from 0.1 $\mu\text{F}$  to 0.47 $\mu\text{F}$ , and the VCC capacitor (C1) is greater than ten times  $C_{\text{BOOT}}$ . It is recommended to use fast or ultra fast reverse recovery time bootstrap diode  $D_{\text{BOOT}}$ .
- ▶ In Figure 6, the LX pin voltage drop can be improved by adding  $R_{\text{LX}}$  ( $R_{\text{LX}} = 1$  to 10 $\Omega$ ), because the  $dv/dt$  is affected by ( $R_{\text{LX}} + R_{\text{UGATE}}$ ).

Figure 6. LX Pin Resistor

- ▶ If the gate current loop opens circuit for some factors, at this time the current flows through the gate loop via the power MOSFET drain-to-gate parasitic capacitor. The current will charge the gate-to-source parasitic capacitor to result in power MOSFET wrong action. The power switches can be damaged or burned out, the resistors (about least 10k $\Omega$ ) are connected between the gate and source pin can prevent malfunction of the power switches.

- ▶ The selection of larger parasitic capacitor power switch or gate resistor may result in too long turn-off time making the high-side and low-side power switches shoot through. In order to prevent the situation, reverse parallel with diodes ( $D_{UGATE}$  &  $D_{LGATE}$ ) in the  $R_{UGATE}$  and  $R_{LGATE}$  (shown in Figure 7), providing a fast discharge path for the power switches in a short time to complete the closing operation.

Figure 7. Reverse Parallel with Diodes
